# MACKENZIE VALLEY PIPELINE INQUIRY

IN THE MATTER OF AN APPLICATION BY CANADIAN ARCTIC  
GAS PIPELINE LIMITED FOR A RIGHT-OF-WAY THAT MIGHT  
BE GRANTED ACROSS CROWN LANDS WITHIN THE YUKON  
TERRITORY AND THE NORTHWEST TERRITORIES FOR THE  
PURPOSE OF THE PROPOSED MACKENZIE VALLEY PIPELINE

and

IN THE MATTER OF THE SOCIAL, ENVIRONMENTAL AND  
ECONOMIC IMPACT REGIONALLY OF THE CONSTRUCTION,  
OPERATION AND SUBSEQUENT ABANDONMENT OF THE ABOVE  
PROPOSED PIPELINE

(Before the Honourable Mr. Justice Berger, Commissioner)

Yellowknife, N.W.T.

March 8, 1975.

C.D. Bailey  
In Chief

Yellowknife, N.W.T.

March 8, 1975.

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

CHARLES DAVID BAILEY, sworn:

THE SECRETARY: State your  
full name, please.

A Charles David Bailey.

DIRECT EXAMINATION BY MR. SCOTT:

Q Mr. Bailey, I understand  
that you're a registered civil engineer in British  
Columbia, Quebec and Ontario.

A Yes sir.

Q And you are a graduate  
of the Royal Technical College in Glasgow, which is  
now Strathcona University.

A Yes sir.

Q That you're a registered  
civil engineer in the State of California, as well.

A Yes, I am.

Q And a life member of the  
Engineering Institute of Canada.

A Yes.

Q A Fellow of the American  
Society of Civil Engineers.

A Yes.

Q And I understand also  
that you were the former chairman of the Test Committee,  
C.S.A. Pipeline Code.

A Yes, I was.

C.D. Bailey  
In Chief

1 Q I understand that for a  
2 period of time from 1964 to 1970 you were the chairman  
3 of the Board of Consultants of the Bechtol Corporation?

4 A Yes, that was in the City  
5 of San Francisco.

6 Q What do they do?

7 A I think the main function  
8 of the Board there was to make certain that the task,  
9 contemplated task facing Bechtol was within their  
10 competence; and secondly, to make certain that it was  
11 inherently a good undertaking of the company, and for  
12 the country in which it was located.

13 Q And what is your present  
14 occupation?

15 A I'm consultant with  
16 H.A. Simons, a firm of civil engineers and consulting  
17 engineers in the City of Vancouver, and other parts of  
18 Canada.

19 Q And Mr. Bailey, have you  
20 had any particular consulting function from time to  
21 time, or done any work in northern areas?

22 A Yes, I have.

23 Q What is that?

24 A I was responsible as  
25 chairman with Bechtol for the design of the test  
26 station at Inuvik in the north up here.

27 Q Well now, Mr. Bailey,  
28 if you'd like to carry on with your presentation we  
29 would be grateful.

30 A Thank you.

C.D. Bailey  
In Chief

1 Mr. Commissioner, it appeared  
2 to me that the description of the natural gas industry  
3 which was a subject selected by the Inquiry, could be  
4 addressed or dedicated to the human and other life  
5 continuing within the areas of the valley of the  
6 Mackenzie Valley or the Mackenzie River, and the entry of  
7 the river into the Beaufort Sea, and the coastal reaches  
8 fronting on that sea. If this is acceptable to you,  
9 it involves my view of the climatic and other factors  
10 of life support of the regions with the conclusion that  
11 life, while perhaps not abundant, can be both favored  
12 and rewarding within the valley.

13 Old and new cultures can be  
14 developed by the people and contributions can be made  
15 by them towards the development of others. It would  
16 appear that human life within the valley must be more  
17 dependent than elsewhere on the continuation of an  
18 indigenous life forms -- the plants, the fish, the  
19 birds, the animals -- that the remarkable climate  
20 within the envelopment of the area by the 50 degree  
21 Fahrenheit isotherm makes it a practical and to many a  
22 very desirable place in which to live.

23 Therefore before coming to  
24 the subject, perhaps you would permit me a parable.  
25 In Teheran in Persia, which is another oil and gas  
26 area of the world, it formerly was pleasant in the  
27 dusk of the evening to sit in good company among the  
28 gardens of the city and to listen to nightingales sing.  
29 This bird, with a habitat ranging across the western  
30 Europe to the British Isles, has a singular purity of

C.D. Bailey  
In Chief

1 song. There are no longer nightingales in Teheran.  
2 The noise and exhaust of automobiles and the emissions  
3 of industrial plants have forced replacement of the music  
4 by that provided by transistor radios. The birds of  
5 the Mackenzie are different to the nightingale in  
6 responsibility, in determination and courage, but all  
7 Canadians share their need for survival.

8 Natural gas. The land and  
9 sea covered by the scope of this Inquiry contains  
10 reserves of natural gas which may prove to be substan-  
11 tial. Analysis of the gas already discovered show that  
12 it is of great purity, and value in keeping with the  
13 north. What is this gas? And how did it accumulate  
14 where it has been found?

15 The amended National Energy  
16 Board Act of 1969 and '70, C-65 has two definitions of  
17 natural gas, Part I:

18 "Gas, except for the purposes of Part 6, means  
19 natural gas or other hydro-carbon or other  
20 mixture of hydro-carbons that is in a gaseous  
21 state."

22 Part 6 states:

23 "Gas means natural gas or any fluid hydro-  
24 carbon, or any fluid mixture of hydro-carbon  
25 other than oil."  
26  
27  
28  
29  
30

1                                    Although in many countries  
2       natural gas is considered to be simply the gaseous  
3       phase of crude oil. The Canadian legal definition  
4       of something other than oil is logical for a number  
5       of reasons. One of these is that sub-surface accu-  
6       mulations of natural gas, not apparently related to  
7       liquid oil accumulations are known in many parts of  
8       the world. There is some evidence that gas accumulated  
9       later than oil and that it is of biogenic origin with  
10      sources in the great masses of vegetable matter  
11      deposited in the depths of the seas.

12                                  Oil is considered to have its  
13      source in marine and land animal matter. Gas appears  
14      to have formed after the formation of oil and to  
15      have migratrated from a wider distribution of very  
16      minor quantities to concentrations where it became  
17      entrapped and sealed. May I have slide one.

18                                  In this slide is a typical  
19      textbook illustration of a gas resevoir and indicates  
20      that a drive of water up through the permeable layer  
21      of sedimentary rock pressed the gas and oil upwards  
22      until the gas was retained by the caprock above it  
23      and in this particular slide it is shown in con-  
24      junction with oil, but it could very well be alone  
25      as simply a gas reservoir.

26                                  The evidence shows that  
27      anerobic micro-organisms assisted in the formation  
28      of the gas from the decomposition of the dead plants  
29      and marine matter lying under the seas and that  
30      the gas was actually formed in strata and deposited

1 by the sea, that is, this anerobic treatment of the  
2 vegetable matter really means that a very elementary  
3 form of life bacteria digested the vegetable matter  
4 and they died and were replaced by following bacteria  
5 for hundreds and thousands of years until the gas was  
6 formed, and entrained in strata being deposited by  
7 the solids from the sea which form the rock  
8 strata.

9                   The pores of these rocks  
10 originally contained salty sea water, so the first  
11 globules of gas therefore had to be about the same  
12 size as the space between the mineral grains forming  
13 the rock. A drive was required to move the gas  
14 through the rock, the permeability of which required  
15 greater force than simple gravitational bouyancy  
16 and the industry believes that the compaction of the  
17 water, subterranean water, by the folding of the  
18 strata caused, gave the pressure to supply the drive.

19                   Slide two. This is another  
20 entrapment of oil shown here, but it could be gas  
21 formed by a shift in the structure of the underground  
22 sedimentary rock, where the section on the right hand  
23 side of the line has been upthrown and cut off the  
24 permeable channel and sealed it and this is a rather  
25 difficult reservoir to find, but a very productive one.  
26 The gas was contained within these sealed chambers  
27 for a time estimated to run from 100 to 500 million  
28 years. A very long time indeed. And there does  
29 not appear to be any material change in the gas  
30 during that time other than the presence of minor

1 quantities of CO<sub>2</sub> and nitrogen suggests that perhaps  
2 some air did get into the strata and caused some  
3 oxidation of the methane which is the principle  
4 constituent of the natural gas.

5 All of the hydrocarbons in  
6 natural gas are flammable and all the members of the  
7 paraffins series, the same series.

8 Could I have the next slide.  
9 The largest component of gas is methane which varies  
10 between 70 and 95% as a rule, ethane, propane and  
11 isobutane , a normal butane, all of these fractions  
12 up to that point have a negative boiling point on  
13 the centigrade scale and all are gaseous at normal  
14 temperature and pressure. The other constituents  
15 other paraffins acopentane, normal pentane, normal  
16 hexane, normal heptane and lighter elements, are  
17 liquid at normal temperature and pressure and have  
18 a positive boilingpoint on the Centigrade scale.

19 Natural gas must have accu-  
20 mulated during the later geological stages of the  
21 oil accumulation, 100 to 500 million years ago, but  
22 only after the consolidation of the containing  
23 strata and after the caprocks were there to provide  
24 for its preservation, where oil contains associated  
25 natural gas, this almost certainly occurs by  
26 saturation of the oil through its contact with the gas,  
27  
28  
29  
30

C.D. Bailey  
In Chief

1 through the contact phase. When we shall  
2 know with certainty and where gas was formed is  
3 problematical. The origin appears to be different  
4 from the origin of oil, although perhaps there is an  
5 association. The natural gases of the Arctic are  
6 those which will materially interest us this morning  
7 are shown on slide No. 4.

8 Two of these analysis are  
9 from wells within the delta, Tagloo and Nigligtak  
10 and they show gas of extreme purity, there's practically  
11 nothing in it but methane. In Nigligtak gas there's  
12 98% methane, perfectly sweet, dry gas, not very much  
13 in the way of liquids to be removed, useful liquids  
14 to be removed.

15 The gas in the polar area on  
16 the islands is the third column, and it similarly is  
17 a high purity, extremely valuable gas. The gas from  
18 Prudhoe Bay is associated gas, that is it's produced  
19 with the oil and it shows quite a different picture  
20 really. It shows a good deal of liquids and a high  
21 CO-2, and some H2S but not enough to make it a sour  
22 gas. So these are the gases that we expect may  
23 be produced within the Territory.

24 The gas from the high Arctic  
25 is a sample taken from a well on Ellesmere Island,  
26 quite a recent well. Industry uses many terms for  
27 gas in its transformation from the well until it  
28 reaches the consumer, and perhaps it would be a good  
29 thing for me to just list them off in their classification  
30 with perhaps some minor explanation.

from within the water, rapid and irregular.

and very dry, and of extreme purity, there's practically

nothing in it but methane. In Niglitak gas there's

gas methane, certainly sweet, dry gas, not very much

in the way of liquids to be removed, useful liquids

to be removed.

The gas in the polar area on

the island is the third column, and it similarly is

a high purity, extremely valuable gas. The gas from

Prudhoe Bay is associated gas, that is it's produced

with the oil and it shows quite a different picture

really, it shows a good deal of liquids and a high

CO<sub>2</sub>, and some H<sub>2</sub>S but not enough to make it a sour

gas. So that the gases that we expect may

C.D. Bailey  
In Chief

1 Dry gas is a gas very similar  
2 to the delta gas, and it's principally a cap gas, that  
3 is it comes out of a cap, not with oil but by itself.

4 Wet gas is a good gas but  
5 carrying condensates with it.

6 Sour gas is a gas containing  
7 hydrogen sulphide.

8 Dissolved gas is a gas which  
9 is contained inside oil in a crude oil reservoir.

10 Associated gas is a gas pro-  
11 duced somewhat from our reservoir shown in slide 1,  
12 where the gas not only was -- had a cap gas arrangement  
13 but also saturated the crude oil.

14 Raw gas is a gas that comes  
15 out of the well, without any treatment.

16 Residue gas is a gas leaving  
17 the process plant which cleans up the gas and prepares  
18 it for the pipeline. We call it the same gas, call it  
19 pipeline quality gas.

20 Natural gas as it is distributed  
21 to the consumer.

22 Mr. Commissioner, there are  
23 a number of analysis of different gases contained in  
24 my paper, but they're more useful, I suggest, to the  
25 record than in a talk, and if I may just pass over  
26 them? Thank you.

27 THE COMMISSIONER: You have  
28 turned your paper in to Mr. Scott, I take it?

29 A Yes.  
30

C.D. Bailey  
In Chief

1                                Natural gas is colorless, it's  
2       odorless, it's non-toxic, and it's lighter than air.  
3       This is generally received by the distribution system  
4       which brings it to your kitchen stove or heater. The  
5       gas makeup may change a little if a proportion of it  
6       is turned into LNG or liquified natural gas, as a  
7       storage in the distribution system, or it may change  
8       a little, if there's any super drying of the gas to  
9       take out all of the liquids that it contains. In  
10      normal -- normally in Canada we add an odorant to the  
11      gas so that its presence can be detected if you  
12      enter a space containing gas.

13                              There are certain safety  
14      considerations with natural gas, as with any flammable  
15      material, and they are related to <sup>its</sup> ignition temperature,  
16      its explosive limits, and its specific gravity, whether  
17      it will rise in the air or not. It ignites at 1185  
18      degrees Fahrenheit, which can be achieved by a match  
19      or an electric spark or a static spark, or a lighted  
20      cigarette, or the elements of a hot car exhaust. It  
21      explodes when 4% of natural gas is contained in air.  
22      That's its lower limit, and its upper limit is when  
23      16% of natural gas is contained in air.

24                              The normal specific gravity  
25      of natural gas is about .55 to about .75 related to  
26      air, and that means that if the room is ventilated  
27      or the space is ventilated, the gas will rise to the  
28      upper part of the room and pass outside. In a basement  
29      that can't happen. While it is non-toxic, it can't  
30      support life because it contains no oxygen

C.D. Bailey  
In Chief

1 and it would be very dangerous to be inside of a room  
2 or space occupied largely by gas.

3                                   Appreciation of gas as a  
4 natural resource.   Natural gas today satisfies about  
5 one-fourth of the total Canadian energy requirements.  
6 The established original reserves, that is the amount  
7 of gas that's been measured, proved to be there, and  
8 lies within the economic transportation of a market  
9 was about 135 trillion cubic feet, of which it was  
10 believed originally that about 80 trillion cubic feet  
11 could be produced and ultimately recovered. 20 trillion  
12 cubic feet have already been produced, or a quarter of  
13 ~~the~~ established produceable total. From 55 to 60  
14 trillion cubic feet remain. The current rate of pro-  
15 duction is about 2 1/2 trillion cubic feet per year,  
16 which suggests a life expectancy of about 20 years at  
17 this time.

18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

1 It is a little difficult  
2 to think of a trillion, you know. It is to me,  
3 it is such a large unit,  $10^{12}$ . The size is really a  
4 little incomprehensible, but as an example if you  
5 could pack natural gas into cubic feet, just a little  
6 parcel 12 inches wide and 12 inches long and twelve  
7 inches high and then took a trillion of them and  
8 built them into larger blocks of a cubic mile, that  
9 is a mile wide and a mile high and a mile long, there  
10 would be about seven of these cubic miles to contain  
11 a trillion cubic feet.

12 The frontier reserves which  
13 are not included in the Canadian producable reserves  
14 at this time are located in the Arctic, the Canadian  
15 Arctic, offshore east and offshore west and they  
16 are speculatively believed to have a potential  
17 greater than 300,000,000,000 cubic feet in place.  
18 Very much larger and more impressive figures have been  
19 advanced by a number of authorities but this is the  
20 lowest of those available to me. Using a 60% recovery  
21 factor it is possible that the recoverable  
22 volume of about 180 trillion cubic feet may be  
23 established to add to the present reserves, hopefully  
24 within the next ten to fifteen years.

25 When and if this occurs  
26 Canada may have 240 trillion cubic feet of recoverable  
27 reserves which are capable of development at annual  
28 rates increasing in ten to fifteen years to perhaps  
29 5 trillion cubic feet per year, or about twice the  
30 present production. Including possibly 1 trillion

1 cubic feet for export as at present. This annual  
2 production would permit gas supplies for about 45  
3 <sup>trillion</sup> years. Evaluation of five/cubic feet per year at  
4 \$1 per M.C.F. -- an M.C.F. is another term used by  
5 the gas people and it means a thousand cubic feet or  
6 about 1 million B.T.U.'s. The evaluation of five  
7 trillion cubic feet which has been mentioned would  
8 be about \$5 billion annually, but a possible --  
9 that \$1 figure, by the way is the present export price  
10 which is, I understand a temporary price and it is  
11 contemplated that it will rise quite quickly -- would  
12 be 5 billions with a possible future value maybe  
13 about 9 billions of dollars. Will this would be  
14 beneficial to us. It is vital to our energy require-  
15 ments and I believe that it will benefit all of us.

16  
17 How to use this gas. There  
18 is disagreement among Canadians on the best use of the  
19 resource. Presently it is mainly burned as a fuel  
20 and produces heat and power in many forms. A  
21 minor opinion considers this wasteful, but with  
22 maximum attainable efficiencies of conversion of  
23 around 30%, the conversions of all fuels are about --  
24 must be considered equally wasteful. Gas has such  
25 singular cleanliness advantages, of cleanliness of  
26 emission and convenience, but the probability is  
27 for continued use as a fuel for residential and  
28 industrial needs for generation of power, when  
29 economics permit and supplies are available and  
30 increasingly for petrochemical resolution into  
fertilizers, textiles and chemicals. All of us

1 know the fertilizers that are so abundantly produced  
2 today, ammonia, nitrogen and uria and many  
3 of us where clothes spun from the polyfibres which  
4 have such special advantages and the petrachemicals  
5 are legion in their number.

6 Natural gas is a valuable  
7 resource of Canada. It is inevitably subject  
8 to depletion and requires wise administration in its  
9 use. So even with the greatly added reserves which are  
10 in contemplation, the very most that we can see is  
11 that the gas will last for 40 or 50 years.

12 Slide number six, Tom, please.  
13 I think that is five -- oh, what is shown here is  
14 the value of various sections of Canadian industry  
15 compared with natural gas and this year it is  
16 expected that about 2 and a quarter billion dollars  
17 worth of gas will be marketed, comparing with  
18 the 3 billion dollars for the steel and iron industry  
19 and 5 and a half billion dollars for the mining  
20 industry and of course the enormous manufacturing  
21 total of 48 billion dollars. The pulp and paper  
22 industry is about 6 billion dollars or about  
23 three times the size of the value of the gas industry,  
24 but you can see that it is quite an important  
25 contribution.

26 The division --

27 THE COMMISSIONER: Excuse  
28 me, Dr. Bailey. Is it not possible for that door to  
29 be kept open or closed instead of it banging every  
30 few minutes? Forgive me --

1                                   A     No, there is no  
2 difficulty at all -- there are three main divisions  
3 in the industry: production, transmission  
4 and distribution and the division of the annual value  
5 of the industry into these branches is about 30% to  
6 production, which averages in Canada now is about 25¢  
7 a thousand cubic feet and 30¢ to transmission, based  
8 on about a 600 mile transmission, such as the West Coast  
9 and 33¢ distribution which is the most expensive  
10 and uses the most people and forms 40% of the  
11 total value.

12                                   One of the problems for  
13 speculation is what effect of the more expensive  
14 gases from the Arctic and from the other sources  
15 expected to produce gas -- what the effect is going  
16 to be with the present gas produced in the provinces  
17 to the south. If we could speculate on that for  
18 a moment and could I have slide number eight.

19                                   Let us assume that the  
20 wellhead price of delta gas in 1980 is 90¢ per M.C.F.  
21 -- per thousand cubic feet -- on a residue basis,  
22 that is after preparation and that transmission cost  
23 to the fiftieth parallel, almost to the U.S. border  
24 are a \$1.10. It would appear that the price of  
25 Arctic gas at this new destination might be \$2.00  
26 per thousand which is a very high figure and its  
27 equivalent related to crude oil is about \$12.60 a  
28 barrel which is about the price of it as it is  
29 sold offshore by Canada at the moment.  
30

THE COMMISSIONER: Excuse me,

1 offshore, did you say offshore sales, offshore to  
2 Canada or by Canada?

3 A By Canada.

4 THE COMMISSIONER: Yes.

5 A The Canadian export  
6 price is about twice the present.

7 THE COMMISSIONER: Yes --

8 A But I am speaking of  
9 five years from now and at the great costs involved  
10 for arctic work

11 Well, gas produced in the  
12 prairie provinces at the same time, that is in 1980  
13 and carried to about the same delivery point might  
14 be priced about \$1.40 to \$1.70 or an oil equivalent  
15 of about \$9.45 a barrel. The total national production  
16 in 1980 could be 3 trillion cubic feet, formed  
17 of 1 trillion cubic feet from the frontier areas,  
18 and that is possibly from the delta and from  
19 the polar system and the reduced 2 trillion feet  
20 from the provinces. The value of the total production  
21 would therefore be \$5 billion a year and the  
22 average price of the mix would be about \$1.67 per m.c.f.  
23 In 1985 with 4 trillion cubic feet marketed, the value  
24 could be \$7 billion, at an average price of about  
25 \$1.75 because of the larger proportion of frontier  
26 gas. The make up of the 4 trillion I have assumed for  
27 1985 is 2 trillion from the frontiers with the provincial  
28 production holding at the same figure.

29 The extra cost of the frontier  
30 gas on the whole volume is about 25¢ per m.c.f.

C.D. Bailey  
IN Chief

1 which is a very moderate figure in my opinion.

2 I think that it is most im-  
3 portant to preserve these differences and I think  
4 that their preservation will be a credit to the  
5 wisdom of the southern producers and will remove any  
6 problem to the industry or to government in handling  
7 two or more prices.

8 Mr. Commissioner, Dr. Hamelin  
9 spoke yesterday of the assistance expected in  
10 the deficit position of the territories, the financial  
11 position and I looked at that, following his address  
12 and his figures appear to line up fairly well with  
13 with my assumptions. The royalties resulting from  
14 a billion/cubic feet of gas produced within the Territory,  
15 that is, not the United States gas, but the just the  
16 production here, would amount to about 55 million  
17 dollars a year and with 2 billion cubic feet which  
18 I think hoped for, would be about \$110 million a  
19 year in royalty and this would leave the producer  
20 75¢ for his work which I estimate would permit  
21 an expenditure of 1 and 3/4 billion dollars in  
22 discovery and production.

C.D. Bailey  
IN Chief

The history of the industry. Natural gas has been in place a great deal longer than man has been on earth. We find remarkably few historical references available to us. There are instances of eternal flames within human race memory, and in Bakow near the Caspian Sea, there was a temple or a former temple which existed from pre-Christian times until about the year 1900. This temple honored or protected a gas flare. In addition, the tradition of burning springs has perpetuated in a number of North American place names. The first practical use of natural gas was probably by the Chinese during the Sho Han Dynasty, early in the third century A.D. The gas was used as a cooking fuel and was transported from shallow wells and seepages through pipelines of bamboo with some compression by hand bellows.

Dr. Torreso mentions a small scale local use in Northern Italy in the 17th century, and also the first known commercial application by William Hart of Predonia, New York, in 1820. Hart's well found gas at 27 feet and supplied some 30 consumers with fuel and light.

Rapid development took place in the United States after that date, including the overland piping of natural gas to the City of Pittsburgh in 1883. By 1890 there were 500 miles of natural gas mains in the City of Pittsburgh.

In Lemmington, Ontario, and the surrounding districts, an established producing and distribution system was operating in 1889 and at

C.D. Bailey  
In Chief

1 west of the United States, and to supply, through dis-  
2 tribution companies, the then/less of a domestic market  
3 was in British Columbia. Almost at the same time the  
4 evolution of the principles of the Alberta Gas Trunk  
5 Pipeline began, primarily, I believe, to ensure that  
6 all reasonable needs of the people and the industries  
7 of Alberta were met and satisfied before any gas left  
8 the province for either the United States or Eastern  
9 Canada.

10 This company at that time was  
11 designed to protect and transport gas from various  
12 shippers and to restore custody to the owners at the  
13 provincial border crossings. With its principles  
14 established in law and part of the trunk system instal-  
15 led in 1957, the building of the Trans-Canada Pipeline  
16 took place, and that system entered service in 1958.  
17 The Trans-Canada Pipeline system is at present the  
18 greatest of all natural gas pipelines, in length and  
19 capacity and in performance.

20 The provision of these three  
21 services, Westcoast, Alberta Gas Trunk, and Trans-  
22 Canada, had a profound effect on production and sales  
23 distribution of natural gas across Canada from Vancouver  
24 to Montreal. The effect on the Canadian economy was of  
25 equal importance. It should be noted at this time  
26 that the three systems mentioned were not planned to  
27 distribute or to sell gas to consumers, but instead  
28 to deliver, and in certain cases, to sell to secondary  
29 pipeline companies, to regional distribution systems  
30 and to U.S. pipeline networks.

1 This planning changed in 1974  
2 when Westcoast became substantially a cost of service  
3 system transporting only gas owned by a B.C. Crown  
4 corporation, which now makes sales and establishes  
5 prices.

7 Since these dates around 1957 and 1958, I must say that  
8 certain aspects of performance have been good. The  
9 corporate care of the land utilized for wells, process  
0 plants and pipelines has generally been faithful to the  
1 spirit of agreements made. The record with labor is  
2 probably as good as the best during the last 25 years,  
3 and conflict, with disturbance to service through labor  
4 difficulties has not occurred. The industry is not  
5 labor-intensive, therefore it has been possible to  
6 maintain levels of wages and other remuneration which,  
7 while related to the levels in localities, were  
8 certainly the best available. As a consequence,  
9 standards of skill and dependability of the men and  
0 women involved in the industry are very high. Access  
1 to the better jobs of responsibility within the industry  
2 has not been unduly difficult, and remarkable records  
3 of individual achievements are reasonably frequent.

A constructive criticism of the overall direction of the industry may be made, however, and we refer to the general lack of long-range understanding of the problems latent to the business. Because of the effect of the monopolies created by the unity of the producers, the charters of the pipeline companies, and the public utility nature of the

C.D. Bailey  
In Chief

1 distributors, the natural resource has been handled  
2 as required by the vice-presidents in charge of sales,  
3 that is it has been based only on the upward thrust  
4 on a sales map.

5 Exploit and export. The  
6 ultimate depletion of the resource and related essential-  
7 lity of the husbanding of supply has been a secondary  
8 and secret matter, at least it has been until curtail-  
9 ment of contract volumes have brought the picture into  
10 the open. I have a cutting here where Trans-Canada,  
11 making a presentation to the National Energy Board,  
12 estimates that it will be short 40 billion cubic feet  
13 by the winter of 1975-76, and that this shortage would  
14 increase to 142 billion cubic feet by 1981.

15 Great volumes of gas have been  
16 exported at prices which paid only slightly more than  
17 the interest on the construction bonds. The general  
18 price level of the domestic sales of gas has been low  
19 enough to cause an expansion of distribution which may  
20 not be maintained in the future. The reduction of  
21 discovery of new accumulations in the provinces may in  
22 fact be due to the scarcity of promising points of  
23 search, as much as any other reason.

24 The profitability of the  
25 industry. The records of year to year trading of  
26 most natural gas companies appear to show, in a minor  
27 way, a profitable history. Average net earnings declared run  
28 between 4 and 6% on the value of the particular assets  
29 involved. Stock dividends from these earnings have  
30 varied from 50 to 75% of the net earnings.

C.D. Bailey  
In Chief

1 Stockholders would have exper-  
2 ienced a very thin time but for the leverage of the  
3 debt equity ratios involved, usually about 2.5 to 1.  
4 The regulated rates of return, which are being handed  
5 down by the regulating bodies are now approaching about  
6 10% of the rate base. The rate base is the value of  
7 the facilities used to earn the money. The rate  
8 base rate of return of 10% involves the servicing of  
9 debt. The debt of the industry in the aggregate is  
10 an enormous sum, and while it is rated secure, the  
11 bonds are generally very long-term, with some maturing  
12 about the turn of the century.

13 The future profitability of  
14 the industry is dependent on a continued supply of  
15 the natural resource, and therefore on further reserve  
16 discoveries. The industry must therefore provide  
17 out of present revenues the funds required to cover  
18 exploration and discovery costs necessary to ensure  
19 this future supply. Profits should therefore be viewed  
20 in terms of today's cost of equipment and construction.  
21 The industry has almost universally and perfectly  
22 legally depreciated its main assets at 2% straight  
23 line, giving a 50-year life basis. However, the fact  
24 is that at present, on a replacement consideration this  
25 2% depreciation rate is on the basis of 112 years life,  
26 as costs have escalated approximately 2 and a quarter  
27 times. 112-year life span is absurd for two reasons:  
28 . The pipelines and the equipment will not enjoy  
29 such a life, and  
30 . There is very little likelihood of natural gas

C.D. Bailey  
In Chief

1 reserves lasting for that time.

2 The industry therefore must  
3 consider a depreciation rate of about 2 1/2 times the  
4 present provisions, or something close to 5%. Under  
5 these conditions it's questionable whether any true  
6 profits are ever made at all in past years. We've  
7 actually been living off the investment. Therefore  
8 in order to provide funds for the future, based on  
9 today's costs, and to maintain the same profitability  
10 currently being reported, the depreciation rate involves  
11 an increase in gross revenues. As an example, at the  
12 old prices an increased selling price of gas at the  
13 international boundary of about 2¢ per M.C.F.

14 I should emphasize that an  
15 increase in the depreciation rate and the resultant  
16 increase in selling price does not increase profits  
17 itself. It tends to secure a real profit and to provide  
18 cash liquidity to the industry, both of which are  
19 required if the industry is to maintain a continuous  
20 supply.

C.D. Bailey  
In Chief

1                                    In the past had such poli-  
2       cies been in effect,    the industry would have been  
3       in a proper cash basis for the provision of future  
4       supply and for the reduction of debt. Employment  
5       provided by the industry -- the number of employees in  
6       all of the industry is not very large, about 25,500  
7       men and women, constituting about a quarter of 1% of  
8       the present Canadian labor force of nine million people.

9                                    When the frontier gas becomes  
10      available, when and if it becomes available, so that  
11      the national marketed volume of natural gas is about  
12      four trillion cubic feet, perhaps in ten years, the  
13      industry employees may total about 38,700 men and  
14      women, about 13,000 more than now, and about .4 of  
15      1% of a Canadian labour force of 10 million people  
16      at that time.

17                                   The distribution of the  
18      workers in the three main branches indicate that about  
19      22% of them are in the production department, 24%  
20      in transmission, and 54% in distribution.

21                                   The regulation of the industry.  
22      Generally in Canada the industry is regulated by the  
23      National Energy Board of Canada, and by Public Utility  
24      Commissions for distribution. In Alberta, where most  
25      Canadian natural gas originates, production and export  
26      from the province is controlled by the Energy Resource  
27      & Conservation Board of Alberta. In British Columbia,  
28      production and exploration is under the control of the  
29      Minister of Mines, and transmission under the Department  
30      of Commercial Transport, and the utilities under the B.C.

C.D. Bailey  
In Chief

1 Energy Commission.

2 In the United States, inter-  
3 state trade in natural gas is closely regulated by the  
4 Federal Power Commission, who also must approve volumes  
5 and prices of import. This slide shows the gas  
6 volumes which have been produced and which I estimate  
7 will be produced in the future, and the value in the  
8 second column. The third column in the grey shade  
9 shows the number of industry employees, and the fourth  
10 column is the number of people who live -- whose  
11 living costs are paid for out of the cheques, the pay  
12 cheques of the people in column 3. There are estimated  
13 to be five per employee, that is a man, his wife, his  
14 children and all of the services that are associated  
15 with making that life possible. These are the Canada  
16 Statistics work force of Canada for the years up to 1975,  
17 say, and the population, with estimated figures  
18 beyond that. You can see from this that this year  
19 about 2 1/2% of the gross national product, of all  
20 of the wealth that's produced in Canada during the  
21 year, will be produced by some 25,500 people who form  
22 about half of 1% of the population.

23 The table indicates that up  
24 to 1975 the industry clearly contributed its share  
25 of the national production of wealth and we hope that  
26 in later years that it will show continuing improvement.  
27 Another consideration, of course, in this production  
28 of wealth is that the industry controls the greatest  
29 per capita investment of equipment and instrumentation  
30 in the nation, and the productivity of the employees

C.D. Bailey  
In Chief

1 should therefore be very high, which it certainly  
2 appears to be.

3                                   The exploration and discovery  
4 of producable natural gas. Apart from the investigation  
5 of surface shows of oil and gas, which may occur by  
6 the fracture of a sub-surface reservoir through earth  
7 movements, the modern exploration is an involved and  
8 time-taking process. Tremendous work and notes of  
9 the Canadian Geological Survey have played a great  
10 part in indicating regions where discoveries are a  
11 possibility. But a series of other surveys are  
12 required, including perhaps the first, an air reconnaissance  
13 survey and air photography. These are really essential  
14 to today's exploration and may furnish valuable photo-  
15 geological interpretations to confirm the later selec-  
16 tion of a drill site.

17                                   Gravity surveys, which, generally  
18 speaking, I think, are made in the north by means of  
19 aircraft, they measure the increases and decreases  
20 of the earth's gravitational field and provide enlight-  
21 enment on what lies below the surface. When a great  
22 number of gravity readings are taken, and digested  
23 and placed on photo maps, it is possible to draw some  
24 sub-surface contours, using the actual gravity lines  
25 which these points produce. The interpretation of  
26 the contours is a dicey affair <sup>on land</sup> and twice as difficult  
27 when over water. Before commitment to drilling is  
28 made, promising areas <sup>are</sup> more closely/scrutinized by  
29 seismic survey. See slides 9 and 10 now.

30                                   This is a seismic crew

C.D. Bailey  
In Chief

1 drilling to place a shot in the shot-hole and I think  
2 the next slide shows the shot actually taking place.  
3 This method of exploration involves back-breaking  
4 efforts by highly trained crews and utilizes the  
5 effect of an explosion or an impact near the surface  
6 of the land. The explosion or impact forces develop  
7 longitudinal waves which pass through underlying  
8 rock formations with differing velocities. Reflection  
9 and refraction of these waves are measured by time  
10 intervals between the explosion and the receipt of  
11 the refracted waves back to the point where they  
12 started. The measurements delineate, with some  
13 accuracy, the nature, depth and dip of the beds of the  
14 rock structures. More sophisticated methods of  
15 seismic survey have the vibroseis technique, and  
16 the reflection survey, the latter is used extensively  
17 and gives good depth estimations.

18 The purpose of the seismic  
19 search of course is to locate accurately the stratigraphic  
20 traps, reservoirs which may contain oil or gas  
21 or both, and the reef accumulations of gas. The  
22 seismic survey is more rapid and less costly at  
23 sea than on land. Ice-covered waters, however, present  
24 special difficulties of electrical noise which is  
25 being studied at the moment.

26 We cannot pass over this  
27 subject of exploration and discovery without paying  
28 our respects to the special quality of men involved  
29 in discovery. Their work lies in the deserts and the  
30 wilderness, and there's a synthesis of discovery.

C.D. Bailey  
In Chief

1 However analytical the cataloguing of results may be,  
2 here is a work of hands.

3 What personal motives have  
4 these men? We believe their drive is to do their very best  
5 today to improve the tomorrow and to plan for the  
6 discovery which proves that what they have done was  
7 right in all ways, and this must be the very best of  
8 all rewards to working men.

9 I'm afraid that all of the  
10 work and money spent in locating a drill-site simply  
11 defines a location where it is possible that an accumu-  
12 lation of gas might exist. Perhaps three years after  
13 the first aerial survey we might hope to reach a  
14 time of decision to drill, and a rig may be spudded  
15 in.

16 The gas well. Here comes a  
17 series of slides now. I think we could go through  
18 them slowly. I think that's a well in the Sahara.  
19 It looks as if it was snow but I don't think it is.  
20 This is a well in the Yukon Territory at Pointed  
21 Mountain. I think the drilling is just completed on  
22 the upper one and just about to be started on the  
23 lower one.

24 The first slide was in Libya,  
25 yes, it was in the Sahara all right. This is a Utah  
26 drill-site.

27 I should perhaps say that  
28 the drill-sites in the delta won't look at all like  
29 this. I think first of all there will be cluster drillings  
30 and these mud ponds will be in tanks. The whole thing

C.D. Bailey  
In Chief

1 will be very much tidier looking. This is a rig de-  
2 signed to go to 20,000 feet, and is also not likely  
3 to be seen here. This is a jack-up rig at sea,  
4 probably in the Gulf of Mexico, I think, and they'll  
5 drill 12 to 16 wells right from that one point, if  
6 they intend using it as a production platform. Another  
7 deep rig, this one is in Utah, in the mountains,  
8 there's tremendous action in this picture. I must  
9 admit that all my life I've had great admiration for  
10 men who work with their hands. That's a drill crew  
11 working right on the head-works. I'm not sure if  
12 that's the same crew or not, but it possibly is. I'm  
13 afraid most of the pictures actually show drill rigs  
14 rather than wells, but a well isn't very much to show  
15 you. It's a very simple piece of piping involved.

16 The discovery hole must yield  
17 a great deal more than gas. Foot by foot it has to  
18 prove or modify the exploratory and seismic data in  
19 the hands of the crew, and when it reaches the designed  
20 depth and is proven a well rather than dry hole, the  
21 production levels are chosen on the basis of what  
22 exists rather than what was indicated.

23 Drill tests of the well may  
24 prove gas but the structure has to be delineated, and  
25 an estimate made based on the flow, the porosity of  
26 the rock and its permeability, in order to define the  
27 area and volume of sedimentary pay likely to flow to each  
28 well to establish the spacing.  
29  
30

1                                   The field perimeter,  
2   that is the limits of the reservoir itself, can only  
3   be defined by further drilling and in due course  
4   an estimated volume of the gas accumulation, its  
5   cost of development provides the guidelines, of a  
6   decision of feasibility of the production of the  
7   new gas field..

8                                   You have one or two more  
9   slides, there, Tom, have you?

10                                  Oh, this is a drill stem test.  
11   -- with the burning gas and condensate and with a  
12   flare turned horizontal to preserve the structure of  
13   the rig. These tests are quite brief and happen --  
14   occur only at the time of discovery. They may involve  
15   one or two days and that is all.

16                                  This is a similar drill stem  
17   test, but taken from a floating drill rig I think  
18   in the Aegean Sea, this picture was taken, and that is  
19   just fine.

20                                  That is in Prudhoe Bay and  
21   perhaps I could -- the cost of a well is very important --  
22   it varies with the factors of accessibility and  
23   climatic restraints and I have a number of round  
24   figures here which might illustrate to you what the  
25   costs may be expected to be. In northern British  
26   Columbia, in the Yukon, and in the Delta about \$4 million  
27   a well. In the Rocky Mountain foothills about \$2  
28   million. <sup>a well</sup> In the high Arctic, that is in the Panarctic  
29   groups work, about \$8 million. <sup>a well</sup> In the United Kingdom  
30   North Sea, about \$5 million, in the plains of Alberta

There have been one or two cases

of this kind, but I have not

any more. It is a still even fact.

— With you but you are not concerned with a

large number of cases of this kind.

— The fact is that the picture is not

clearly in the line of discovery. They may involve

one or two, but that is all.

This is a picture of the

fact, but I have not a picture of the

in the same way, this picture was taken, and that is

just that.

There is in this picture

perhaps a little — the fact of a well is very important

million

arctic

idom

etc.

1 about half a million dollars a well. In Texas,  
2 U.S.A. about half a million dollars a well.

3 All of the work from the in-  
4 ception of exploration to the discovery and the  
5 installation of the well might extend from about  
6 five to seven years. And perhaps longer if a pipeline  
7 has to be approved by government and then constructed.  
8 The flow lines of the gas field. The flow lines  
9 connect the gas well to the dehydrator equipment and  
10 thence to the field gathering pipelines, the processing  
11 plant and the main transmission line. IN the  
12 provinces these works tend to have a temporary  
13 appearance because of the frequent changes that are  
14 required as well as are added, closed down or modified.

15 At Prudhoe Bay and presumably  
16 in the Mackenzie Valley, cluster wells, flow stations  
17 and central process plants will be designed to  
18 reduce wear and tear on the environment during  
19 the construction and operation. This cluster well  
20 concept was employed successfully in the United  
21 Kingdom North Sea and in Holland, where the land won  
22 from the sea is of such importance to the people.  
23 It worked splendidly. Clusters of ten to fifteen  
24 wells drilled offset covered the production of  
25 several square miles of land with an occupational  
26 area of only a few acres.

27 Perhaps I could -- this is  
28 a very formal diagram of course -- these well  
29 clusters, each with about twelve to fifteen wells in  
30 them will be located where the coverage will be the

1 greatest and not necessarily in an orderly row like  
2 this, but they will be limited in area and the  
3 facilities for drilling one well can be used in  
4 drilling another and not repeated with a mud bath  
5 for every drill hole and from each of the clusters  
6 a single line will carry the gas to a flow station  
7 where it will be dehydrated and prepared and there  
8 may be six or seven or maybe a dozen of these  
9 well clusters and then the gas flows into the gas  
10 process plant where the liquid hydrocarbons are re-  
11 moved, not very much in the way of liquid hydro  
12 carbons from the analysis of the gas of the Delta  
13 and any waste liquids like brine are injected  
14 back into a safe strata below the ground.

15                   The gas flows out of the  
16 process plant, provides local fuel gas and goes  
17 towards the pipeline.

18                   As the gases of the Mackenzie  
19 gathering lines will be warm, it is expected that  
20 these pipes which are shown and indicated here will  
21 be carried above the ground on supports from point to  
22 point in an orderly manner probably paralleling  
23 short service roadways. The arrays may zigzag  
24 slightly to allow for contraction and expansion as  
25 the temperatures within and outside the pipes  
26 change from time to time.

27                   At the wellhead even  
28 gases with an analysis as sweet and dry as those  
29 given for the Mackenzie Delta contain water and water  
30 vapor. The gases also carry particulate matter from

1 the wellbore, chips -- rock chips, and sand and  
2 cement. These are mechanically separated from the  
3 gas immediately at the well. Water vapor is also  
4 removed as it could form hydrates of ice in combin-  
5 ation with some of the hydrocarbons. When the  
6 gas pressure is lower then the gas expands. The  
7 temperature falls with it. This removal may be  
8. done by absorption or solution processes or by  
9 molecular sieves. The sieves may take out some of  
10 the CO<sub>2</sub>. When the well pressure is sufficiently high  
11 an expansion refrigeration cycle will remove the  
12 water to the required dew point depression specified  
13 by the pipeline which is to support the gas.

14                   The nitrogen and CO<sub>2</sub>  
15 fractions shown in the analysis before in the slide  
16 are small and possibly the pipeline will accept the  
17 nitrogen. The CO<sub>2</sub> is mildly corrosive and if  
18 there is also a trace of hydrogen sulfide, both can  
19 be removed in a combined treatment with an amine  
20 solution. If the gas has to be transported as a  
21 liquid, and this is contemplated at the moment for  
22 the gas being found on the Arctic Islands. If it  
23 has to be transported as a liquid it must be  
24 purified at the well head to a very high degree and  
25 all the H<sub>2</sub>S and CO<sub>2</sub> has to be removed and it is then  
26 passed through molecular sieves for drying and for  
27 removal of the heavy hydrocarbons and then it is  
28 liquified by reducing its temperature down to  
29 -250°F in a series of trains of multi-refrigeration  
30 processes with the frequent recompression to

1 drive it through the system.

2 Nitrogen is easily removed  
3 in this process as it does not liquify at the  
4 temperatures used.

5 When the gases are liquified  
6 to L.N.G., liquified natural gas, some of the heavy  
7 hydrocarbons removed early in the process may be  
8 put back into the liquified gas to raise the calorific  
9 value of the L.N.G. to the requirements of the market.  
10 The gas is then stored in large double wall insulated  
11 tanks from which it can be loaded into the insulated  
12 carriers; ships or tank cars, or whatever you have.

13 The by-products removed  
14 at the processing plant are numerous and valuable.  
15 Sulphur, propane, butane, and I noticed the Arctic  
16 island gas contained an amount of helium which is  
17 extremely valuable.

18 The natural gas transmission  
19 pipeline. Where a gas discovery is made and the  
20 obvious market is thousands of miles away, it is  
21 inherent that the pipe be large in diameter. A  
22 small pipe or a medium sized pipe, especially costly  
23 to install, would require as operation costs such  
24 a large proportion of the final sales price that  
25 the gas discovery would be of little actual value.  
26 Roughly speaking, about 24 to 25% of the total  
27 cost of an arctic pipeline would be required each  
28 year as pipeline revenue for a feasible undertaking  
29 and the only way to keep the unit cost of transmission  
30 within practical limits and the distant transport

1 of great volumes is a large diameter pipe, 36, 42, 48,  
2 or 56.

3 The maximum through put of  
4 a pipeline, how much you can get through, is proportional  
5 to the diameter to the power of 2.5 to/operating pressure,  
6 of the nature of the gas and the profile of the  
7 route. Definition of the size of the line therefore  
8 is subject to the producable reserves established,  
9 the possibilities of further gas discoveries on the  
10 route, the costs of the damages involved per mile and  
11 the financing plan available to the pipeline company.

12 The designers of the pipeline,  
13 they will have a drive to validate as high a flow  
14 as possible, as large a diameter as the flow will require,  
15 as high as an operating pressure as the pipe metalogy  
16 will permit subject to the special low temperature  
17 toughness considerations of the Arctic. All of this  
18 is a complex and lengthy study, but one, which  
19 when completed, with consideration of the terrain,  
20 will help establish the probable cost of the pipeline  
21 and albw final study of the development to proceed  
22 and eventually construction to take place.

C.D. Bailey  
In Chief

1                                   The gas will require to be  
2 raised in pressure from the first process plant exit  
3 pressure to that selected for the operation of the  
4 pipeline. This will be done at the initiating compres-  
5 sor station where the gas may also be cooled to a  
6 temperature below 30 degrees, to safeguard against  
7 temperature effects on the terrain. The gas pressure  
8 will be depraved by the friction of distance and by  
9 topographical losses as it travels southward, and  
10 this will require intermediate pressure restoring  
11 compressor stations originally about 130 miles apart,  
12 and perhaps as close as 40 miles apart when the pipeline  
13 is fully powered. These stations will each require  
14 50 to 75,000 installed horsepower. In general, up  
15 to the present have been fueled by the gas in the  
16 pipeline; it may be that the economy of this almost  
17 universal practice will be re-examined in the light of  
18 the new values of natural gas, and perhaps other forms  
19 of power will be utilized.

20                                   An ideal would be a self-  
21 restoring hydro-electric power generated in the country  
22 which the pipeline traverses, but this may be too  
23 much to hope for because of the long time it takes to  
24 build hydro-electric generating equipment.

25                                   However, the liquids removed  
26 from the gas at the process plant may prove sufficient  
27 for the fuel needs of the first and perhaps the second  
28 compressor station. This, in the absence of an oil  
29 line, will present a dual advantage of useful disposal  
30 and gas economy. I should say that the biggest customer

C.D. Bailey  
In Chief

1 the gas pipeline has is itself. It burns a tremendous  
2 quantity of gas to drive the gas through the pipe, and  
3 that must amount to somewhere between 5 and 7% of all  
4 the gas carried.

5 The other stations following  
6 the first and second may have to continue with gas  
7 as a fuel, although some liquid supply may become  
8 available on the route. I said that because you pass  
9 quite close to Fort Norman where oil is available.  
10 Any pipeline crossing the provincial or territorial  
11 boundaries, or having an international destination  
12 must be designed and constructed to the requirements  
13 of the National Energy Board of Canada which can be  
14 expected to include special environmental and socio-  
15 logical protection, design requirements specific to  
16 the project, the requirements of the C.S.A. standards,  
17 together with any special requirements of the province  
18 or of the territory.

19 A construction plan of the  
20 pipeline. The possible construction plan of the  
21 Mackenzie Valley Pipeline must contain the solution  
22 to the very large logistics problem which is involved.  
23 This solution may be assisted greatly by the general  
24 route being accessible to materials by rail, by river,  
25 and by coastal sea transport. While the construction  
26 people involved <sup>dependent for</sup> transport and sustenance  
27 will be by air, the construction force may number in  
28 total (without including services), about 5,000 people.  
29 The effect on the valley and its people must be very  
30 carefully controlled to ensure that it is temporary

C.D. Bailey  
In Chief

1 minimal and hopefully, beneficial. We believe the  
2 route will be carefully divided into sections, where  
3 construction tends to be similar -- under-ground or  
4 over-ground, or by soils analysis, and that in these  
5 sections, bases will be emplaced, possibly where future  
6 administration and service centres are planned. Each  
7 base will have an air field with complete navigational  
8 aids, communications, health centres, stores, dormitor-  
9 aries and work shops. They may be connected to the  
10 river by road. Double-jointing of pipe, coating or  
11 repair of coating, and principal maintenance of  
12 heavy equipment will be carried out in the section  
13 bases. Sub-bases or portable camps will reach out  
14 upstream and downstream of the base and be arranged  
15 so far as possible for all-season programs.

16 I don't quite know how many  
17 bases are contemplated for this pipeline, but probably  
18 four or five. When ground conditions or wildlife  
19 movements do not allow continuous year-around work,  
20 the men will be moved seasonally to sections of the  
21 route where they can help advance the project.

22 We believe that the regions  
23 traversed by the Mackenzie Valley Pipeline can stand  
24 the wear and tear of a wisely planned construction  
25 program. How the people of the valley will make out  
26 depends, at least in part, on the work of this Inquiry.  
27 We wish it well, as do all Canadians.

28 Construction may last about  
29 three years, and will be an opportunity to display the  
30 common sense, the reason and the responsibility of

C.D. Bailey  
In Chief

1 the Canadian people during the great project. I have  
2 no doubt about that.

3 A Base load concept for a pipe-  
4 line. Natural gas from the frontier, when available,  
5 is not likely to greatly increase the existing distri-  
6 bution systems. It may maintain the present rate of  
7 export, but should not materially increase this volume  
8 of about one trillion feet annually. It will, of  
9 course, greatly reduce the proportion of marketed gas  
10 exported. We believe the major effects will be the  
11 replenishment of supply, and security of the future,  
12 with further use in the electrical power generation and  
13 petro-chemical production. It is very important that  
14 the great cost of the frontier developments be reflected  
15 in their efficient operation. The through-put of most  
16 existing gas pipelines vary with demand from season to  
17 season, and even from hour to hour, modified by any  
18 storage facilities near the delivery ends of the  
19 pipelines.

20 In the new system, Mackenzie  
21 Valley as an example, examination should be made of  
22 the possibilities of taking demand swings on the  
23 prairie producers, and holding the Arctic pipeline  
24 on base load as far as possible. This base load, for  
25 illustration, may be slightly greater than the minimum  
26 Canadian demand, plus any storage intake, plus attached  
27 export. The plan would actually employ the existing  
28 provincial production and other facilities closer  
29 to the market as a kind of a quasi storage system,  
30 providing for peaks and swings in demand and would

C.D. Bailey  
In Chief

1 permit the new facility to operate at near constant  
2 rate and maximum efficiency insofar as load balance  
3 is concerned.

4 Mr. Commissioner, I have a  
5 film which takes about 18 or 19 minutes, showing the  
6 construction of a recent major pipeline during the  
7 winter, and this would be a suitable time to show  
8 that.

C.D. Bailey  
In Chief

1 THE COMMISSIONER: I wonder if  
2 Mr. Carter wishes to object to that film?

3 MR. SCOTT: No, he is reserving  
4 it for cross-examination later.

5 Excuse us, Dr. Bailey,  
6 carry on.

7 A I felt it would be a  
8 good thing to mention the operational hazards of a  
9 large pipeline at this time. Hazards exist, and in  
10 our opinion they are unlikely to seriously affect  
11 the environment or the people. Incidents in industry  
12 experience have been rare, and all have been strictly  
13 local in nature.

14 Hazard exists in the base  
15 centres, as in any set area of human concentration,  
16 fire is the most serious and its effect when local  
17 to the buildings involved might be heightened by the  
18 problem created for occupants under severe winter  
19 weather conditions. In the compressor stations,  
20 fire from mechanical failure again can be the most  
21 serious happening. The industry automation practice  
22 reduces the number of people on the site, and protected  
23 safety arrangements for the control room almost  
24 certainly save the staff. The fire would be extinguished  
25 by closing off the gas supply to the station and would  
26 be of very short duration, probably less than an hour.  
27 It may require that the station be by-passed, which  
28 would reduce the throughput of the pipeline until  
29 repair was made. On the pipeline itself, everything  
30 will be done to ensure the safety of the pipe; but

C.D. Bailey  
In Chief

failure can occur, either through accidental collision of a vehicle with a pipe, or through a metallurgical fault. Pipe failure usually results in fire at the point of rupture. A fire, if it should occur, could be extinguished in two to three hours by the automatic cut-off of gas, through the drop of pressure within the pipe. It will cause total damage to the pipe involved but little else, and should not exceed one mile in length.

No cleanup will be involved, and we would expect repair to be completed and service restored within 80 hours of the incident.

The hazards of transport and travel are real<sup>enough</sup> in the north, but the procedures of the pipeline company should reduce these to a minimum level. Distribution of natural gas to consumers.

I've been asked to move ahead fairly quickly. Engineering of a distribution system is fairly well standardized and is of high quality, as is the inspection service. In spite of the safety records, in spite of this the safety record has occasionally been marred by disruptive incidents which caused concern. A distributor has two special responsibilities, he is the cash register for the entire industry, payments for all gas sold excepting for export are received by him. The distributor deducts from these payments his own costs and return, and remits the balance to the transmission company who in turn pays the gas producer and gathering pipeline, retaining a balance for transmission costs. The distributor is the latest contact with the general

C.D. Bailey  
In Chief

1 public. These responsibilities have been handled quiet-  
2 ly and well and the companies involved have earned a  
3 certain community respect over the years. In Canada  
4 there are three types of distribution agencies:

- 5 . Private enterprise companies
- 6 . Crown corporations
- 7 . Community ownership.

8 Groups (a) and (c) are  
9 generally regulated as to prices, schedules and  
10 practice by Public Utility Commissions of the  
11 provinces. Group (b) is answerable to the Provincial  
12 administration, and of course there is a difference  
13 in access for the consumers in the two forms of  
14 regulation. Distribution appears to work fairly well.  
15 The Crown companies are more heavily staffed and  
16 therefore not quite so economical as the private  
17 enterprise companies. The future for the Canadian  
18 industry.

19 I've tried today to give  
20 a kind of a capsule description of the industry as  
21 it is, and I hope the gas involved has not been too  
22 anesthetic in its effects. On the future of the  
23 industry, I have spoken to several of its leaders  
24 with the conclusion that they see about as much of  
25 the future as I do, which is not a great distance.  
26 There is uncertainty of the changing political  
27 government pressure on the private enterprise founda-  
28 tion. This is a reasonable state of doubt under  
29 present circumstances, and should be cleared up. The  
30 industry performance shows a healthy rate of metabolism.

C.D. Bailey  
In Chief

1 which indicates that greater and better directed  
2 progress can be made. In my opinion, it is essential  
3 for a national policy in gas and oil to be established  
4 as soon as possible. Who owns the gas in the reservoirs  
5 of Canada? I'd like to see it made clear that this  
6 belongs to the people of Canada, now and in the future.  
7 The administration of the resource is in the control  
8 of the provinces, and should so continue. But it must  
9 be laid down that the people of British Columbia,  
10 are Canadians living there; the people of Alberta are  
11 Canadians, even if they live in Calgary; and the  
12 citizens of Quebec are Canadians all with a vital  
13 interest in industry. Controls should therefore be  
14 limited by the obvious requirements of a reasonable  
15 treatment of the consuming provinces by the producing  
16 provinces, so that the coherence of all our people  
17 is increased. The cost of gas in any part of Canada  
18 should vary only with the cost of transmission,  
19 long or short, and of course the producing area is  
20 favored by this thought.

21 The gas produced, when the  
22 royalty and other provincial dues are paid, should  
23 become the real property of the producer and must  
24 command a price giving a fair return on funds for  
25 future discovery. The present prices are too low,  
26 and an adjustment will not affect the competitive  
27 position of the product. Moreover, any property owner,  
28 including the gas producer, has responsibility and  
29 he must produce and deliver or be replaced by someone  
30 else. Such an industry <sup>has</sup> no place for capricious

C.D. Bailey  
In Chief

1 handling of gas supply. Gas and oil people present  
2 an independent aspect to the public, they're not  
3 independent at all. They built up an infrastructure  
4 and depletion and other allowances and special tax  
5 treatment; this creates general distrust among many  
6 Canadians. The recent spectacle of Syncrude increased  
7 this, particularly when a pioneer company is performing  
8 reasonably well under the present circumstances.  
9 But enough of this. Criticisms are well meant and  
10 the particulars of over-employment of limited reserves,  
11 low financial profitability of the industry's own  
12 making, poor amortization of funded debt, and an unwillingness  
13 to put all of the costs into the gas bill,  
14 all of this is in the hope that the future will be  
15 more profitable than the past, that produceable reserves  
16 will increase, and that financial liquidity will develop  
17 and will improve. The industry is vital to our welfare  
18 and I hope for its success.

19 Thank you, Mr. Commissioner.

20 THE COMMISSIONER: Thank you  
21 very much, Mr. Bailey. The Inquiry appreciates very  
22 much your coming to share with us the benefit of your  
23 great knowledge and experience in surveying the industry  
24 for us. Thank you again, sir.

25 (WITNESS ASIDE)

26 MR. SCOTT: Mr. Commissioner,  
27 can I suggest a break of about 1 1/2 to 2 minutes when  
28 everyone who wants one goes outside and gets a cup of  
29 coffee and brings it back? I want to continue right on  
30 if we can. Is that satisfactory, that rather arbitrary

R.F. Legget  
In Chief

1 recommendation?

2 (PROCEEDINGS ADJOURNED FOR TWO MINUTES)

3 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

4 MR. SCOTT: Mr. Commissioner,  
5 the next Commission witness in the overview is Dr.  
6 R.F. Legget.

8. ROBERT FERGUSON LEGGET, sworn:

9 THE SECRETARY: State your  
10 full name, please.

11 A Robert Ferguson Legget.

12 DIRECT EXAMINATION BY MR. SCOTT:

13 Q Dr. Legget, I understand  
14 that you're a graduate of the University of Liverpool  
15 and did your graduate work in engineering at that  
16 university as well.

17 A That is correct, sir.

18 Q And then you came to  
19 Canada in about 1929.

20 A '29, yes.

21 Q I understand that from  
22 1936 until about 1947 you taught in the Engineering  
23 Faculties of the University of Toronto and at Queens.

24 A That is correct, sir.

25 Q And that in 1947 you were  
26 the founding director of the building research, I  
27 suppose a division or section of the National Research  
28 Council.

29 A That is correct, yes.

30 Q And you remained director

R.F. Legget  
In Chief

1 of that division until your retirement from the National  
2 Research Council in 1969.

3 A That is correct, sir.

4 Q I'm also told that in  
5 1940 you made the first of a long series of visits to  
6 Northern Canada, the Arctic and the sub-Arctic.

7 A Correct.

8 Q Yes. So this territory  
9 is well known to you, is it?

10 A Not as well known as  
11 perhaps it might be, but I've seen most of it.

12 Q I understand also that  
13 from 1944 until 1969 you were the chairman of the  
14 Associate Committee on Geotechnical Research at the  
15 National Research Council.

16 A That is correct, sir.

17 Q And that in fact in  
18 1972 you were the chairman of a pipeline conference.

19 A Yes.

20 Q Who organized that  
21 conference?

22 A The National Research  
23 Council, through the Associate Committee.

24 Q Yes. Well now, Dr.  
25 Legget, I told you not to stint yourself. Don't worry  
26 about time, we began a little late today, that's  
27 not your fault. Please carry on as you think best.

28 A Well, Mr. Commissioner,  
29 I would like to start, sir, by thanking you and your  
30 staff for permitting me the privilege of meeting with

R.F. Legget  
In Chief

1 you on a Saturday morning. I'm only sorry that the  
2 hour is so late, but when I look at the task that  
3 has been assigned to me on your behalf, sir, of review-  
4 ing construction in northern Canada, if I'm to be  
5 worthy of the task that is mine, I can't do it in half  
6 an hour, but I will try to be moderate in my time,  
7 sir, and I would like to say that if there are any  
8 questions, Mr. Commissioner, that you would like to  
9 ask, or your staff, while I am proceeding, this I  
10 would welcome because I'm attempting to condense what  
11 is an immense subject into a reasonable constrictus.

12 What I would like to do,  
13 sir, is first of all and perhaps a little unusually,  
14 to give an historical sketch of construction as we  
15 know it in these modern days, in Northern Canada because  
16 in a very strange way that can be comprehended within  
17 my own lifetime, in 1940, for example, I saw the first  
18 machinery going in for one of the first little water  
19 power plants, and this gives a different outlook, I  
20 think, to the problems with which you are faced.  
21 Secondly, to speak in a little detail about the devel-  
22 opment of the Town of Inuvik, which typifies problems  
23 and solutions of construction in the north.  
24 Thirdly, to deal very briefly with the major problems  
25 facing construction in the north, and then to deal  
26 with something that might at first <sup>sight</sup> seem to be a little  
27 unusual, but I hope to be able to show that it is  
28 part of the overall picture, and that is what I'd  
29 like to call the information problem on northern  
30 building, and then finally to make a few concluding

R.F. Legget  
In Chief

1 remarks to show how all this ties together in what  
2 is one of the most remarkable phases of construction  
3 in Canada.

4 In doing this, sir, I propose,  
5 subject to your agreement, to confine my remarks  
6 generally to the Western Arctic, although much of what  
7 I will say will apply to the Eastern Arctic also; not  
8 to say anything about the Yukon because the Yukon  
9 story is a different one, and it doesn't really affect  
10 directly developments in the Mackenzie Valley, and  
11 finally, as a final preliminary which I say with some  
12 embarrassment, but after discussing with others what  
13 it was thought you would like to hear, and what might  
14 assist you, I find that in making the presentation  
15 I shall be forced to talk about things that I have  
16 been personally involved in, which is against the grain,  
17 I don't normally do this, and so I beg your indulgence,  
18 Mr. Commissioner, if I mention the first person more  
19 frequently than is my want.

20 Starting with history, then,  
21 the remarkable thing is that it is such a very short  
22 history, because there was really nothing significant  
23 in the way of construction in Northern Canada until  
24 we come to the 1930's, which is over a relatively  
25 recent date. Until that time the only construction  
26 that took place of any significance was the erection  
27 of buildings, simple buildings, and ancillary structures  
28 by the Hudson's Bay Company, the independent traders,  
29 and the Royal Canadian Mounted Police.

30 This, when one first makes

R.F. Legget  
In Chief

1 such a statement, is usually questioned, but I've  
2 never yet had anyone who, after they had looked into  
3 it, find that the statement is inaccurate.

4 This being the case, one  
5 says, "well, what about transportation?" Transporta-  
6 tion was very elementary, even though the Hudson's  
7 Bay Company did introduce the first steamboat on the  
8 Mackenzie River system in 1886, which goes back of  
9 course quite a long way; but this was a very simple  
10 steamboat and it was operated merely for three months  
11 to serve the small Hudson's Bay post down the river,  
12 and didn't involve any construction, and so even with  
13 this I think one can still say that until the 1930's  
14 construction was something literally unseen up here.

15 The first airplane flight to  
16 the north, as probably has been mentioned, and I  
17 do hope, Mr. Commissioner, I don't repeat what has been  
18 said by others earlier this week, the first flight  
19 to the north was in March, 1921. The Royal Canadian  
20 Airforce started the aerial survey work that has meant  
21 so much and has permitted the preparation of maps such  
22 as the one behind me in 1922. Imperial Oil had made  
23 their small discovery of oil at Norman Wells in 1920.  
24 They drilled the first wells in 1921, but there was  
25 no market for the oil; confirmation, I think, of lack  
26 of any activity in the north, and so the six wells that  
27 had been drilled were capped in 1924, and remained  
28 capped and unused until the '30's.

29 The small refinery that  
30 Imperial Oil build at Norman Wells, the one that is

R.F. Legget  
In Chief

1 familiar to many of us, was erected in 1939 when  
2 things had started, in a way that I shall mention in  
3 just a minute, and some of the oil from that small  
4 refinery was taken up to Great Bear Lake through what  
5 probably  
6 has been already mentioned, the first oil pipeline  
7 in Northern Canada, around the Bear River Rapids, which  
8 was constructed in 1939. It was 8 1/2 miles long, not  
9 much of a pipeline, but it was the first northern  
10 pipeline.

11 Then after that, things increased  
12 in activity, mainly because of the start of mining.  
13 Mining started on Lake Athabasca and Great Slave Lake,  
14 in the 1930's, with the discovery of gold, and on  
15 Great Bear Lake, with the discovery of uranium ore  
16 in the same period, and this is a very wonderful part  
17 of the whole story of the opening up of the north.

18 By 1940, that is at the end  
19 of the '30's, the mills were capable of producing  
20 1,700 tons of ore per day. A small quantity by normal  
21 standards, but a lot for Northern Canada; the first  
22 water power plant, a very small one of 3,300 horse-  
23 power, had been erected in 1937-38, to serve <sup>the</sup> little  
24 mines on Lake Athabasca and the town of Goldfield.  
25 The second water power plant was built in the year  
26 1940 to '41, now this is where I saw myself, some of  
27 this activity, again a very small one, 4,700 horse-  
28 power, to serve the gold mines in this Yellowknife  
29 area.  
30

1                                   The cost of the first  
2 plant, the Wellington Lake plant was \$1.5 million,  
3 to generate only 3,000 horsepower and of that \$1.5  
4 million 1/6 of the total cost was the transport  
5 of the materials. I mention this figure, sir, to  
6 indicate as will become more and more evident  
7 the key place that transportation occupies in all  
8 northern questions and in particular in construction  
9 in the north.

10                                Reviewing the situation  
11 in 1940, the town of Goldfield existed on Lake  
12 Athabasca with the population of 1,000. It disappeared  
13 within ten years and there is nothing left.

14                                The Town of Yellowknife had  
15 a population of about 1,000, the same in 1940 and  
16 we know what it is today. El Dorado had been shut  
17 down. There was no market for the uranium ore,  
18 a strange commentary on what was to happen so shortly  
19 after, and in 1940, to date the period and the  
20 recent activity in construction, the Hudson Bay Com-  
21 pany was still using their sternwheelers still  
22 fired with wood that was carried on board by men  
23 from wood lots on the side of the river. I saw  
24 this, I travelled on these ships.

25                                The first diesel tugs  
26 had just been introduced a few years before to  
27 push barges instead of the sternwheelers. The  
28 Northern Transportation Company had just started  
29 because of developments in relation to El Dorado  
30 and Hay River, which we now know as such an important

1 transportation centre was a small Indian village  
2 and doing what does not come naturally, Mr.  
3 Commissioner, may I say that I have here a copy of  
4 a paper that I wrote in 1940 entitled "Construction  
5 North of 54" and in this I describe everything that  
6 had been done and it consisted of one small water  
7 plant, the refinery at Norman Wells and the beginnings  
8 of a second water power plant and that was about  
9 all and I could not even mention permafrost because the  
10 name had not been invented. But we recognized the  
11 existence of perennially frozen ground.

12 Then, Sir, the war came and  
13 this of course changed things forever. In the  
14 first place, El Dorado was opened up, the Northern  
15 Transportation Company and the mine were taken  
16 over by the Government of Canada and we all know  
17 the results of that takeover and the reasons for it.

18 The most significant develop-  
19 ment though, in relation to your immediate studies,  
20 Mr. Commissioner, was the development of the CANOL  
21 pipeline. This was one of the strange developments  
22 of the war, but at the time seemed to be a rational  
23 and reasonable thing to do, because of the fact that  
24 the Japanese had over run the sources of oil in the  
25 far east and it was done with the best of intentions  
26 and with magnificent courage and enterprise although  
27 fortunately it never really had to be used to any  
28 significant degree.

29 Very briefly it meant the  
30 construction of a pipeline from the Mackenzie River

1 opposite Norman Wells, over the mountains to White-  
2 horse and this was a tremendous undertaking because  
3 this area had not been surveyed, it was difficult  
4 terrain indeed and with all the complications and  
5 logistics of building a pipeline that was about  
6 2,000 miles long -- 1,500 miles long, a telephone  
7 line and a road, but this was done in about two years.  
8 It cost, we do not know how much. The estimates  
9 vary from \$150 million to \$300 million. The \$300  
10 million is probably the more accurate. The pipeline  
11 itself was a four inch line first and then a six inch  
12 line, the telephone line ran the whole length as did  
13 the road.

14 The building of the line  
15 was carried out by American Armed Forces and it was  
16 possible because economics did not enter into  
17 it. The job had to be done and it was done, at  
18 tremendous expense of manpower and great economic  
19 drain, but in times of war this can be forgotten.  
20 It did involve though, and this is the one thing that  
21 is significant, the transfer of 60,000 tons of  
22 freight on the old system coming up from  
23 Edmonton by the Northern Alberta Railways to waterways,  
24 transfer by barge to waterways, barge from waterways  
25 to Fort Fitzgerald above the portage at Fort Smith,  
26 transfer over the portage to Fort Smith and then  
27 reshipment in barges from Fort Smith down the  
28 Mackenzie to Norman Wells and the fact that this small  
29 and very limited transportation system, with the aid  
30 of all the money that was needed and all the manpower

1 that was needed was able to transfer 60,000 tons  
2 in those two seasons, whereas previously 20,000 tons  
3 in one season was an outside maximum, is one of the  
4 great construction achievements of the war.

5 The line was abandoned, the  
6 pipe, insofar as it was possible, was removed, the  
7 buildings were used, if they could be moved and I  
8 find it significant to be standing here when our own  
9 first research station in the north was located into  
10 rather derelict CANOL buildings. They did not  
11 last very long but we did use them.

12 To the west during the  
13 war there was the building of the Alaska Highway  
14 which should be mentioned and the construction of  
15 the airfields on the northwest staging route. Again,  
16 great construction achievements, but with little signi-  
17 ficant effect on the Mackenzie Valley. To the north,  
18 immediately after the war, but we can count it in the  
19 war time period, was the construction of the six  
20 joint U.S.-Canadian, or as I now prefer to say,  
21 Canadian - U.S. weather stations at Resolute Bay,  
22 Noel Bay, Alert, Isaacson, and Eureka. These  
23 were a development of the need seen during the  
24 war for much more information about Arctic weather.  
25 Their installation was a magnificent performance.  
26 Again, economics did not count and so they did not  
27 give us any significant information that can be  
28 used for peacetime purposes, but they represent a  
29 significant achievement in the north. They are  
30

R.F. Legget  
In Chief

1 still operated, now under completely Canadian  
2 operation with U.S. participation. We do not know  
3 what they cost because the large flotilla of ships  
4 that brought in the materials was largely a naval  
5 operation, one of the greatest naval flotillas that  
6 the north has ever seen, if not indeed the greatest,  
7 but we do know that it costs today about \$3 million  
8 to operate those six small stations which gives  
9 some indication of the economics of the logistics  
10 of operating stations of that kind.

11 The buildings themselves  
12 were simple in the extreme, naturally, single storey  
13 buildings, the equipment not very elaborate, some  
14 towers but not unusual towers and so again they did not  
15 give us very much in the way of construction experience.

16 Then after the war, after  
17 the weather stations were operating, other develop-  
18 ments took place. Again, and I will put these,  
19 if I may, Sir, first, with regard to the needs  
20 for defense. One of the most interesting and one  
21 of the most little known was the erection of a  
22 very large steel tower for Norvan purposes, navigation-  
23 al purposes at Kittigazuit. It was in the days when  
24 radar and radar navigation developments were accel-  
25 erating rapidly and <sup>so</sup> it was not necessary to use  
26 it for many years, but it was erected on perennially  
27 frozen, silty ground with all the difficulties that  
28 that involves. It performed quite satisfactorily  
29 and stood for about ten years before it was disman-  
30 tled. A quite phenomenal achievement in view of the

1 lack of information at that time about design in  
2 the north. Much more important though were the  
3 developments of the three defense radar lines.  
4 The distant early warning line, the DEWline, the pine  
5 tree line and the mid Canada line. These too were  
6 done by the Forces of the United States and Canada  
7 at a cost that we now can be fairly certain exceeded  
8 at a cost -- that did exceed \$1 billion. A remarkable  
9 sum and because they were so secret at the time and  
10 to a degree still, we have very little information  
11 about the constructional problems. Something was  
12 published about the remarkable work done in locating  
13 the sites by means of aerial photography and this  
14 was one of the first major applications of aerial  
15 photo interpretation and the sites selected were all  
16 done in this way and then checked on the ground  
17 and so far as I know have all proved satisfactory.  
18 The mid Canada line has now been phased out of  
19 operation and so the buildings stand there untouched  
20 and unsung. The other two lines are still  
21 operating, still performing faithfully their  
22 intended function, but again without too much  
23 significant contribution to the techniques and the  
24 knowledge and the information necessary for  
25 ordinary construction in the north, but they must be  
26 mentioned because they do represent such a tremendous  
27 contribution.

28 If I might now turn, sir,  
29 to the developments in mining. The mines at  
30

1 Yellowknife although not at Goldfield were still  
2 operating at the end of the war and in 1945 the total  
3 value of the mining products in the north and I  
4 give these figures, sir, as an indication of  
5 the activity and the degree of mining, was half a  
6 million dollars. In 1955 it had risen to \$25 million  
7 and in 1965 to \$77 million and in 1975, this  
8 year, it might be as much as \$100 million which is  
9 quite a lot of production from mines and yet to  
10 set it in perspective, this represents only about  
11 2.5 % of the total mining production of this  
12 country, so that even though the Pine Point mine, which  
13 represents a large proportion of this total, is a  
14 very eminent mining operation and a very large  
15 one, it still is only a part of a much bigger operation  
16 if we look at it country wide. But what it did  
17 do, was that it fully opened up the proper development  
18 of the Pine Point mine, it led to the construction --  
19 it with other things, led to the construction of the  
20 Grimshaw Road to Hay River and then following that  
21 the construction of the Great Slave Lake Railway by Canadian  
22 National Railways that is now operating so satisfactor-  
23 ally. This railway was built - - I speak of the  
24 railway rather than the road -- was built between 1962  
25 and 1967 at a cost of about \$86 million, for a length  
26 of 432 miles and it has been operating quite successfully  
27 with no problems because of the fact that its location  
28 was most carefully evaluated by those responsible.  
29 First by aerial photographs, then by using the ad-  
30 vantage of the unusual geological features along the

R.F. Legget  
In Chief

1 way and as a result of this and I stress the matter  
2 of location and planning, Mr. COMmissioner, for  
3 reasons that will later be obvious, the reasons that  
4 have made the Great Slave lake Railway such a  
5 satisfactory and efficient operation, but it had of  
6 course another effect. It destroyed for all time  
7 the old transportation system to the western  
8 Arctic through Edmonton with NORthern Alberta Railways  
9 to Waterways at Fort MacMurray, then the sail by  
10 barge down the Athabasca to the Portage, the use  
11 of the Portage to Fort Smith and then down to  
12 Great Slave Lake, because as we all know, now we  
13 have Hay River as a great transportation centre  
14 and I would, sir, if I might invite attention to the  
15 fact that the construction by the Northern Transpor-  
16 tation Company of their really outstanding synchronous  
17 drydock facility at a cost of, I believe, something  
18 like \$10 million has set the seal for a long  
19 time to come on Hay River as the transportation,  
20 trans-shipment point for all shipments for the  
21 western Arctic and the Mackenzie River Valley and  
22 this is perhaps, anyway the most significant construc-  
23 tion development of which I can speak.

24 Taking a brief glance of  
25 at the eastern Arctic, and I mention this more as  
26 a matter of interest, sir, than of value, because it  
27 is something planned but not constructed. There was  
28 in the days when transatlantic flying was all by pro-  
29 peller planes the urgent demand for major air base  
30 as far to the east as possible that could be used

1 by transAtlantic planes for refueling and a great deal  
2 of money, more than one million dollars, was spent  
3 on the planning of a great development at Frobisher  
4 Bay, a new airport, a remarkable building complex  
5 and all the ancilliary features. Fortunately it was  
6 not built -- I say fortunately because the planning I  
7 think might have been improved slightly by what we know  
8 now -- because of the advent of jet planes, and Fro-  
9 bisher Bay of course has been developed but in an entirely  
10 different way from what was planned in the 1950's --  
11 one of the unwritten parts of Arctic development.

12 But I turn finally, sir,  
13 in this historical view, on which do hope I am not  
14 spending too long, but I hope that it will give  
15 the overall constricture, to the development of the  
16 town of Inuvik. As you know, sir, and most of those  
17 present until Inuvik was developed the main centre  
18 in the north was the town of Aklavik and a friend of  
19 mine was the man who founded the first little building  
20 that led to Aklavik being developed as a centre. It  
21 was developed as a signal station by a young lieutenant  
22 in the Royal Canadian Corps of Signals in 1922 and  
23 he has often said to me how much he regrets putting that  
24 signal station in that particular spot -- not that a  
25 settlement was not needed, but that particular  
26 spot was singularly and unfortunately chosen because  
27 it lies on a plain in the great delta, that is only 11  
28 feet above normal river level and of that 11 feet, as  
29 we discovered in our test drilling, six of the 11  
30 feet consists of ice and 5 of the eleven feet consists

1 of soil and therefore when after the war, when the  
2 Government of Canada did finally -- start to  
3 look at the needs of the north and what should be  
4 done to provide the necessary facilities and Aklavik  
5 was looked at and a new school was planned for Aklavik,

6 test drilling was carried out on the site by some of  
7 my colleagues, and we found this state of the ground.  
8 This showed that if any development took place and  
9 if any further development of the surface took  
10 place, as was necessary in any decently finished off  
11 term, that there was likelihood of serious settlement  
12 and therefore the flooding which had unfortunately  
13 affected the residents of Aklavik every year, at the time  
14 of the spring flood, would be far worse and since the  
15 needs of people then, as always comes first, it was  
16 seen immediately, but because of this condition of  
17 the ground, development of Aklavik in the ordinary  
18 way just was impossible and therefore at a meeting of  
19 the advisory Committee on Northern Development of the  
20 Government of Canada, a committee that included the  
21 deputy ministers of all the interested departments,  
22 a meeting held in 1952, at which I was present, we  
23 reported the results of these investigations of sites  
24 at Aklavik, after much discussion and with the greatest  
25 concern for what was involved, that committee recom-  
26 mended <sup>to</sup> the Government and the Government accepted the  
27 decision that a new townsite had to be found.  
28  
29  
30

1 A team was developed by the inter-  
2 ested departments and the National Research Council.  
3 It did the initial study of the entire delta in Ottawa  
4 in the building of the Building Research Division by  
5 photo-interpretation methods. And in the winter, on the  
6 tables of the divisional building, twelve sites were  
7 selected as the best twelve sites in the entire area of  
8 the delta, one hundred and fifty miles by fifty miles,  
9 As soon as the spring came, the first helicopter in the  
10 North was sent north to assist the survey work. The  
11 twelve sites were studied, they were narrowed down to  
12 four. I was privileged to go up there and study each  
13 of the four with others, and it was quite clear that one  
14 of the four was the most desirable. We then called it  
15 "East Three". And I was privileged to be there in  
16 the summer of 1954, just before the final decision was  
17 made by the then Minister of Northern Affairs, The  
18 Honourable Jean Lasauge. He came up there to make the  
19 decision on the spot. The site was chosen for reasons  
20 that I needn't detail, because these have sir, been  
21 written up, and one of the references that I might  
22 perhaps present to your offices, is a paper that describes  
23 the selection of the site of Aklavik. It's called "The  
24 New Aklavik", the name had not then been chosen, and  
25 this describes the method that were used, the reasons  
26 for the move from Aklavik, and the reasons for the choice  
27 of Inuvik. Mainly the grading, the local geology.

28 Then the planning started, and I  
29 needn't go into any detail on this sir, because you know  
30 the town, and you know that because of the condition of

1 permafrost, all the buildings, apart from a few simple  
2 ones, had to be founded on piles, which I shall be  
3 mentioning in just a minute. The simple buildings were  
4 founded on pads, another technique. The roads were  
5 carefully laid out so that they would be well drained.  
6 There was a good supply of building material, and a  
7 reasonable anticipation of getting a good water supply,  
8 and so the town was developed, and so it is today.

9                   And two years ago, I had the  
10 privilege of visiting it again, and examining every  
11 building, in detail and I found not any single evidence  
12 of any failure of any sort in the foundations of that  
13 town; even though it is built on what many might regard  
14 as the most difficult ground conditions to be found any-  
15 where in Canada. This is, I think, a testimony to the  
16 design of the consulting engineers, and the construction  
17 techniques of those who built the town.

18                   And at the same time, of course  
19 Yellowknife was developed. But here the problems were  
20 different, with so much solid rock, which in one/<sup>way</sup>is an  
21 advantage, in another way is a disadvantage, but this  
22 was the beginning of the developments that we now know  
23 as the New North.

24                   Well this, Mr. Commissioner, is  
25 a brief summary of construction in the North, which is,  
26 as you see, is a story really of the last thirty-five  
27 years. Against that background, might I now ask if we  
28 might consider together the major problems facing anyone  
29 who wants to build anything in the North, whether it be  
30 a pipeline or any other major construction development.

1                                   And I say any other because it  
2 has been said time and time again, that if there is a  
3 need for it, and if the economics justify it, it's possible  
4 to build anything in the North. Jokingly we have said  
5 that we would build a fifty storey skyscraper at Resolute  
6 Bay, if someone will pay for it, and then someone explain  
7 why it is needed. This is said in joke , but it has,  
8 as do many seemly facitious statements more than a grain  
9 of truth in it, because our knowledge of the North is  
10 such now that this now can be done. The question as to  
11 why it is needed, and who is going to pay for it, are the  
12 impediments. And against that, I would like therefore to  
13 ask what are the problems that can now defeat, if we know  
14 about them and if we do proper planning.

15                               I submit sir, that there are four.  
16 First, the matter of permafrost. Secondly, the matter of  
17 the effects of climate. Third, the matter of transportation,  
18 and the economics associated with transportation. Fourthly,  
19 and perhaps in some ways the most important, the matter of  
20 manpower.

21                               Now I understand Mr. Commissioner,  
22 you have a briefing with regard to permafrost from my  
23 friend Dr. Ross McKay, so I will start, if I may, knowing  
24 him as I do, where I think he probably left off. As you  
25 know, and as he stressed sir, permafrost is not a material,  
26 despite all the things that are said about it. It is a  
27 condition of the ground. The condition of the ground  
28 wherein it is perennially frozen to some appreciable depths,  
29 because of the local average air temperature. This being  
30 the case, if ground is solid rock, there is no real

R.F. Legget  
In Chief

1575

1 problem. That is why, at Yellowknife for example, building  
2 is no problem from the point of view of permafrost. If  
3 however, the ground consists of water bearing soil, silt  
4 clay or even fine sand, the water will be ice and if you  
5 interfere with that, then you are going to have problems,  
6 and therefore you must somehow preserve the condition of  
7 the ground if your building is to be successful.

8 If there were time sir, to quote  
9 from ancient references we could give you many, of early  
10 settlers in the North, notably from the Hudson Bay  
11 Company who discovered this to their cost. There are many  
12 small buildings that show what will happen if you don't  
13 know what you are doing, and if you don't preserve the  
14 integrity of the ground.

15 Against that background, let me  
16 suggest that in design, when you have to design  
17 structures in the North, there are three ways of protecting  
18 the ground in its frozen condition. Either, in the first  
19 place, you isolate your structure completely by putting  
20 them on piles, as has been done at Inuvik. That's the  
21 best of all examples. The utilidor~~s~~, the buildings, the  
22 schools, as you know are all above the ground, so that the  
23 air in wintertime can flow underneath them, and keep the  
24 ground in it's frozen condition, and in this way preserve the  
25 integrity of the permafrost, And as is obvious to anyone,  
26 this has worked entirely satisfactorily, despite the extra  
27 cost involved, but there is no problem as a result of any  
28 undue settlement or interference with the ground. A  
29 second way, is to, if you have to interfere with the  
30 ground, to install a refrigerating plant and freeze the

1 ground after you have thawed it. This sounds rather  
2 stupid, but there are some cases where this is the only  
3 solution. Fortunately, through design and good fortune  
4 we have not had to use this solution in Canada yet.  
5 There is however, a power station in Alaska, that is  
6 maintained in its position by refrigeration of the ground  
7 beneath it. A very costly way of doing it, but it can  
8 be done. The third way is the simple way. Of calculating,  
9 as one can, what depths of fill, preferably a porous  
10 fill, like sand and gravel or crushed rock, what depth of  
11 fill you need above the natural ground, preserving it by  
12 suitable means, such as placing brush over it, what depths  
13 you need to prevent the heat from the building that you  
14 are going to put on top of the slab reaching through the  
15 thickness of your pad of granuline material into the ground.  
16 If you make the depth thick enough, then the heat will be  
17 dissipated before it reaches the ground. I trust I am  
18 explaining this in reasonable terms sir, because it is  
19 a matter of heat transfer. And it is possible, by very  
20 straightforward methods, to calculate the depth of sand  
21 that you need above any permafrost condition, if you know  
22 what it is. To be certain that the heat from the building  
23 you erect above will not reach the ground and therefore  
24 the permafrost will be preserved. And the best of all  
25 examples is the airstrip at Inuvik.

26 Here was a demand for the  
27 building of an airstrip, to carry the largest planes  
28 available on the worst possible condition, because it  
29 was unusually high water-bearing silt upon which that  
30 airstrip had to be built, because of location requirements,

1 and therefore, before work started the ground was studied  
2 The permafrost was investigated carefully, the ground  
3 above, the muskeg cover was not interfered with at all,  
4 and we were then able to calculate the necessary depths  
5 of crushed rock in that case, that would be needed upon  
6 which the airstrip could be founded. When the calculations  
7 were done, it was checked independently by one of our  
8 friends in the United States geological survey, who agreed  
9 with the figures, and the airstrip was designed on that  
10 basis. In order to do the necessary and desirable  
11 research, as it was being built, recording thermo couples  
12 were imbedded in the fill and they have been observed  
13 and read regularly from that time to this. I checked on  
14 the results just before coming away to this meeting sir,  
15 and I am assured the airstrip is still performing  
16 exactly as it had been planned, despite the fact that  
17 you have there a black surface that absorbs solar radiation.  
18 And therefore have one of the very worst possible conditions  
19 for thawing the permafrost condition, unless you have  
20 taken precautions.

21 The precautions were taken,  
22 actually the permafrost has risen slightly, rather than  
23 degrading, and the strip is performing and has a surface  
24 today that is the equal of any airstrip anywhere in  
25 Canada. Despite its location, so it can be done, and  
26 this is the reason that I mentioned this particular case.

27 Turning to the difficulties in  
28 construction presented by permafrost, these are very  
29 easily stated, because they fit with what has to be done  
30 in design. If you are on ground that consists of the

1 frozen water bearing silt, this is going to be kept in  
2 its condition in practically every case, by the protective  
3 cover of muskeg, to use the delightful Indian name I  
4 like but other scientists don't, they call it peatland,  
5 but may I say in your presence, we use the term "muskeg",  
6 because then we all know what we are talking about.

7                   The muskeg, mainly because of its  
8 high moisture content, it's like a great sponge, acts  
9 as a perfect insulator for the material underneath.  
10 And, as I am sure that everyone who knows the North, has  
11 seen, this is fine, providing you don't disturb it.  
12 If you disturb it by running just one run of a bulldozer  
13 over it, you will compress it, you will squeeze the  
14 water out, you will interfere with its insulating  
15 effect and when you come back next year, those ruts will  
16 be deeper, because the solar radiation has had a chance  
17 to operate, and you have ruined something that can never  
18 be replaced. And therefore the one key in construction  
19 which is absolutely mandatory, is that nothing must  
20 disturb the muskeg cover, if you are anxious to preserve  
21 it for your design purposes.

22                   Perhaps, I might just use one  
23 minute to give a rather graphic example. When the small  
24 road was being built from Uranium City to the little  
25 port of Bessell on the north shore of Lake Athabasca, the  
26 foreman in charge of the road building was an old man  
27 who knew the North, who knew muskeg, and who knew  
28 exactly what to do. He didn't let his men even walk on  
29 the muskeg before they cut the brush down and covered it  
30 with brush, and they walked on the brush. The sand and

1 gravel for that road was placed on the brush, and a good  
2 road was obtained. He went away on a two weeks holiday.  
3 While he was away, his assistant took over, His assistant  
4 was a younger man, who knew everything, and knew that  
5 the old man was just being silly, and so proceeded to  
6 bring a bulldozer in and tore the muskeg off. If you  
7 ever, Mr. Commissioner, drive along that road, may I  
8 suggest with great respect, that about halfway along, on  
9 the northern side you will see an area that looks as  
10 though it had been a volcano. This is the silt that  
11 was disturbed by that two weeks operation of the bulldozer  
12 and it took five years before it came to a stable condition.  
13 The road had to be changed. So this is a perfectly simple  
14 perfectly straightforward , but very difficult requirement  
15 in construction. And it is difficult because it affects  
16 access.

17                               These sir, are the ways in which  
18 permafrost, once you know it, can be dealt with, in design  
19 and construction. But my qualifying words are, or course,  
20 vital. The primary requirement is that you must, if I  
21 may presume to use such a word sir, emphatically, you  
22 must know what site conditions are in detail before any  
23 work is planned and certainly before any construction work  
24 is carried out. And in order to do this, you must therefore  
25 know what the structural function is of the structure  
26 that's to be erected. If there is to be any heat loss  
27 from it then the necessary calculations must be done in  
28 advance.

R.F. Legget  
In Chief

1                                      This is the special sort of  
2                      that must be done  
3                      planning/before any construction, be it small or  
4                      great, is carried out once the southern limit  
5                      of        permafrost is passed.

6                                      Now comes the second problem  
7                      and that's the effect of climate. This we can deal  
8                      with fairly easily because it's fairly straight-  
9                      forward. You will know, Mr. Commissioner, from what  
10                     others have said, that it's not the intensity of the  
11                     cold in the winter that is the serious problem, it's  
12                     the duration of the cold. The further north one goes,  
13                     the greater the number of degree days, the greater  
14                     the length of the winter season, the greater the  
15                     problems of winter construction, and these are problems  
16                     with which Canada and the Canadian construction industry  
17                     is fully familiar. Perhaps it's not out of order for  
18                     me to say that when it comes to winter construction  
19                     methods, Canada leads the world. There is no doubt  
20                     about this, people come from many countries to see  
21                     how we carry out construction in the winter in Southern  
22                     Canada, the methods in the north are just the same  
23                     except that they have to be used for longer periods.

24                                     The most serious one is the  
25                      necessity for lighting during the winter months on a  
26                      scale that is not known in the south; but again this  
27                      is an easy problem to deal with, provided you know it  
28                      in advance; and this again points to planning. Here  
29                      perhaps is the point at which I should apologize for  
30                      having to use the word "planning" so often, but by  
                         the time we finish our review you will see that it

R.F. Legget  
In Chief

1 is this, it is the key to construction in the north.

2                   The Mackenzie River flood,  
3 which in some cases as is well know, lifts the level  
4 of the river as much as 60 feet, if you're working  
5 near the river, has to be known in advance and has to  
6 be planned for, but this is know. In earlier days we  
7 did not know very much about the climate of the north  
8 but through the activities at the six Arctic weather  
9 stations, we now have a very clear and a very good  
10 picture of climate throughout the north of Canada and  
11 on the basis of a number of years, statistically  
12 enough can be reasonably certain to predict what climat-  
13 ic conditions are going to be. The information therefore  
14 is available. If the planning is done, I submit, sir,  
15           the climate is not the problem that most  
16 people think it is.

17                   Turning then to the third,  
18 transportation, the big jobs that I mentioned earlier  
19 and one of my reasons for mentioning it was to emphas-  
20 ize this point, such as Canol, the Dew Line and the  
21 weather stations, were all carried out without regard  
22 to normal economics. If you have enough money and  
23 enough men and the need, as I have said earlier, you  
24 can do anything you wish in the north. But when we  
25 come to normal construction, then we have to consider  
26 normal economics, and this means that transportation  
27 of any construction materials and construction equipment  
28 will have to go by land or water. Fortunately, we  
29 have in the Mackenzie River system one of the world's  
30 greatest water transportation systems. Unfortunately,

R.F. Legget  
In Chief

1 available for only three months of the year, but are  
2 showing what can be done now that Hay River can be  
3 the trans-shipment point. Perhaps it has not yet  
4 been mentioned that in 1973 the Northern Transportation  
5 Company carried as much as 400,000 tons down the river.  
6 That's a phenomenal achievement and I've been advised  
7 that they anticipate that with the necessary equipment  
8 they should be able to reach 600,000 tons in one  
9 season. If you compare that with what I said earlier  
10 about 20,000 tons being a maximum for the old system,  
11 you will see what advances have been made.

12 But even that may not be  
13 enough for major jobs, and I'm speaking naturally in  
14 general terms for now, and here is where winter roads  
15 come in, and here perhaps I should stress that while  
16 recently some of us have been delighted to read a  
17 very enlightening and lively account of winter road  
18 construction, perhaps, Mr. Commissioner, you too have  
19 seen it, this of course was on a very modest scale  
20 carried out by wonderful people, to whom we must all  
21 pay tribute; but if winter roads have to be used on  
22 a major scale, then its going to be an entirely differ-  
23 ent operation, in that these roads will have to be  
24 made, that is to say by preparing proper ice formations  
25 where the ice is weak, by proper grading in advance  
26 of winter conditions, and if this is done, our knowledge  
27 of ice as a material <sup>this</sup> has been studied now in building  
28 and snow as a material, and the ways of handling them  
29 are such that it should be possible, with planning, to  
30 prepare winter roads capable of carrying the heaviest

R.F. Legget  
IN Chief

1 needed loads for any sort of construction for an  
2 if one  
3 appreciable period, and/therefore couples the use of  
4 designed and specially constructed winter roads with  
5 the potential of the Mackenzie River system. We have  
6 a tremendously powerful system for transporting the  
7 heaviest loads throughout the entire valley, and this  
8 is one of the good features of the problems that I'm  
describing.

9 But again, and here I must  
10 mention the word again, this means advanced planning,  
11 because the Northern Transportation usually finds them-  
12 selves booked solid before they start to move a ton  
13 from Hay River, and winter roads, as I've just indicated,  
14 can't just for the purposes of major operation, be done  
15 with no planning. They must be planned at least a  
16 year ahead, and for transport requirements on a major  
17 scale, allowing for the facilities that do exist,  
18 wonderful as they are, at least two years of advanced  
19 planning must be done. This, Mr. Commissioner,  
20 is probably the major difference, apart from permafrost,  
21 between construction in Northern Canada and construction  
22 elsewhere. The methods are similar, the equipment is  
23 similar, the materials are similar, but to have to plan  
24 two years in advance is something that in the south  
25 where one can immediately go to a store and buy some-  
26 thing, if you haven't got it; these are the big differences,  
27 and why planning on a major scale has always to be  
28 done for any construction operation, even the smallest,  
29 and why a time scale for construction in the north is  
30 so different to what it has to be and can be in the

R.F. Legget  
In Chief

1 south.

2 The final problem, I ven-  
3 ture to suggest is that of manpower. I'm quite  
4 sure there's little need for me to go into it in any  
5 detail except from a construction point of view, because  
6 others who have preceded me have talked about the  
7 northern people, their needs, their simply marvellous  
8 capabilities, when it comes to construction operation,  
9 capabilities that make us people from the south look  
10 like tender-feet. This, I pay due tribute to, having  
11 seen their skills in operation. But we must remember  
12 that their numbers are limited. The numbers of able  
13 bodied men are limited in the north, and many of them  
14 have already jobs doing excellent and vital work in  
15 the north. So that the number of northerners available  
16 for any major construction operation is limited. This  
17 means that men will have to be brought in from outside,  
18 there are all the problems that that means, and again  
19 this means planning.

20 I mention this problem, sir,  
21 merely to indicate that I recognize it, even though as  
22 I say I'm quite sure it's been dealt with.

23 These then, sir, are the  
24 problems, not insuperable, problems that can be  
25 recognized, if they are recognized and if I might  
26 repeat this one thing, if proper site investigation is  
27 always carried out well in advance of design, well  
28 in advance of construction, anything is possible in  
29 construction in the north.

30 But the planning requires

R..F. Legget  
In Chief

1 information and knowledge, so may I turn to the other  
2 major aspect of this overall subject that I would like  
3 to place before you?

4 This is the nub of the informa-  
5 tion problem. Here, sir, is where I speak with unusual  
6 ~~diffidence~~ confidence, and you'll see why in just a minute. As  
7 I've indicated from what I've said already, the infor-  
8 mation is available for building anything in the north  
9 -- climatic information, permafrost information, in-  
10 vestigation information, you name it, it'S available  
11 if you know where to go, and if you go and get it.  
12 But unfortunately, all too often when we hear of problems  
13 in the north, they are problems created by people who  
14 don't know that the information is available or if they  
15 do, they didn't go to get it, and I have myself seen  
16 to my intense regret, so many examples in the north of  
17 what I would venture to call, with great respect, Mr.  
18 Commissioner, re-discovering the wheel, that I felt  
19 it was desirable that I should ask if I might use a  
20 little of your time to stress the importance of it.

21 I do so because the National  
22 Research Council, as the war came to an end, recognized  
23 that construction throughout Canada, once that awful  
24 war was over, would be something quite different from  
25 what Canada had ever seen before, and so in 1946, before  
26 the war actually was officially over, they had con-  
27 sidered this and decided that the time had come when  
28 they should set up a national construction research  
29 organization, to aid the construction industry which,  
30 as you will know is by far Canada's largest industry,

R.F. Legget  
In Chief

As this industry grew to an extent that even then could not be foreseen and faced problems that never before had been met, and so it was that in 1947 the Division of Building Research of the National Research Council was established, and I was privileged, for reasons that I can never really understand to ask if I would leave teaching at the University of Toronto and go to Ottawa and start something that didn't exist. I talked to people, amongst others, the chairman of the then Defence Research Board, as we groped our way in the early days trying to decide what we should do from the thousand and one things people expected us to do. There was far too much for any one organization to do, so we selected the five major branches of building that were peculiar to Canada, one of which was building in the north, and this was in 1949. We started our work on studying the problems in the north in 1950.

At the time we were regarded as rather unusual people -- I'm choosing my words there, the words used in description were not quite so polite, but some of us had the vision that the day would come when knowledge of the north would be necessary, and so our first effort was to get a young man, a young research officer, and he booked -- engaged a boat at Hay River and went down the Mackenzie River and studied every building that existed in the Mackenzie Valley from Great Slave Lake to the Arctic, examined each one, examined the problems in practically every building in those days, if my northern friends will forgive me, every building had some problem, and then listed them, put it into a report,

R.F. Legget  
In Chief

1 and this was known as the Dooms Day Book of the  
2 Arctic -- of the Mackenzie; but from that book we  
3 looked at the problems, we looked at what had happened,  
4 and from that charted the course that research in the  
5 north should take.

6 The next thing was to  
7 establish a station so that we could study building  
8 in the north. This was established in Norman Wells,  
9 first in the Canol Buildings, later in two pre-  
10 fabricated buildings which will be known to some, but  
11 then we found out that the real problems in the north  
12 were not in the Arctic region where you have permafrost  
13 to great depths, but in the southern regions where  
14 permafrost gradually faded out, and that is why we  
15 were so concerned with the limits of permafrost and  
16 why we moved the station from Norman Wells to work  
17 out of Aklavik in the northern part -- Aklavik and  
18 Inuvik for the northern problems, and to deal with the  
19 southern problems by coming up to them from the south

20 and for 13 years one research officer spent every  
21 summer on this work with regard to the boundary of  
22 permafrost, mainly using helicopter, and from the  
23 basis of that, the permafrost map that I believe Dr.  
24 McKay introduced to you, was produced. This is just  
25 a map but it carried with it not just what normal  
26 maps do, it represents the accumulation of those 13  
27 years of intense hard work in the north. Perhaps  
28 if Dr. McKay did not mention it, I might invite your  
29 attention, sir, to the fact that the map was published  
30 jointly by the Geological Survey of Canada and the

R.F. Legget  
In Chief

1 National Research Council, as an indication of the  
2 way in which people can work together, and not in  
3 watertight compartments, as is sometimes believed to  
4 be the case.

5 This map was produced in 1967  
6 before we knew that we would ever face such exciting  
7 prospects as those with which the Royal Commission  
8 is dealing, and we were fortunate to have it. We had  
9 no second sight, sir, I don't want to suggest that for  
10 one minute, but it was prepared in preparation for  
11 the day when Canada might need it. In addition to that,  
12 work was going on with regard to problems. We used  
13 the Town of Inuvik, naturally, to good effect, because  
14 some of the installations there were experimental.  
15 When necessary, instrumentation was installed so  
16 that we could see how designs worked out in practice.  
17 These are still continuing, and all this work has been  
18 written up, and there is available for those who  
19 want to read it now, a series of papers dealing with  
20 practically every aspect of building in the north  
21 from both the design and construction point of view.

22 Amongst the documents that  
23 was produced was the Building Code for the North.  
24 This is dated 1968. This is a special pocket edition  
25 made in pocket size so that anyone in the north could  
26 slip it into their parka, based on the National Build-  
27 ing Code of Canada, which is used throughout the rest  
28 of Canada, but with a special section on the require-  
29 ments that must be taken, in general terms, when  
30 building anything in the north. I only regret to

R.F. Legget  
In Chief

1 say that not too many copies of it have been used,  
2 even though it's been well-publicized. But here it  
3 is. It is in the process of revision and it was the  
4 first such document to be prepared in English. It  
5 was based, and we have the Soviet document that  
6 corresponds to it, and I'll be speaking of the Soviet work  
7 shortly.

8 The next thing that I  
9 would have liked to have been able to produce at this  
10 hearing I can't because of the only real disappoint-  
11 ment that I suffered in this work, and that was we  
12 had seen the need once the more recent developments  
13 had started, for a manual that brought together all  
14 information on construction in the north, both design  
15 and construction. We planned an outline and started  
16 the work on a manual for northern or permafrost  
17 engineering, but I regret to say that the National  
18 Research Council has not been blessed with the funds  
19 necessary for such operation, and that work had to  
20 stop because of lack of money and manpower. It has  
21 now been taken up again, again with very limited  
22 manpower and very limited funds. I say this not in  
23 any criticism of our government, but in explanation  
24 as to why it isn't here. If all goes well, such a  
25 manual will be available in the fall of this year, but  
26 much later than it should have been.

27 But the information is there  
28 in other forms, and it has been disseminated in a way  
29 that is again not well recognized because the National  
30 Research Council has always taken the view that while

R.F. Legget  
In Chief

1 it does research that is needed in such bodies as the  
2 Division of Building Research, it wants to stimulate  
3 research anywhere else in Canada by those who can  
4 do it, and therefore as all of us know, one part of  
5 its program has been a granting program to stimulate  
6 and encourage research at universities. Not only that,  
7 but under the guidance of the Right Honourable C.D.  
8 Howe, as one of his great / but minor contributions to this  
9 country he started an active program of what are known  
10 as Associate Committees. Now as soon as I mention the  
11 word "committees" in some people's hearing they react  
12 straight away and say, "Well, what, another bunch  
13 of committees?"

14 But this is a very special  
15 bunch of committees. Because of the size of our country  
16 it is not possible normally for those with common  
17 interests living in Vancouver and Halifax to meet and  
18 share their problems and share their experience, and  
19 so ever since the war when this technique was used to  
20 great advantage, the Research Council has set up a  
21 number of Associate Committees, not too many, the  
22 members of which are drawn from coast to coast from  
23 every discipline in one particular field of national  
24 concern, and the Research Council pays expenses only.  
25 The time is given voluntarily, and in this way in a  
26 quite remarkable manner it is possible at any one time  
27 to get the national consensus on any major branch of  
28 science in this country. One of these committees is  
29 the Associate Committee that was mentioned to you  
30 earlier, the Associate Committee is now called

R.F. Legget  
In Chief

1 geo-technical research. It was set up as a special  
2 wartime effort in 1946, but after the war it transformed  
3 its work to civilian work and in 1948 organized four  
4 sub-committees on soil mechanics, snow mechanics, snow  
5 and ice mechanics, muskeg and permafrost research, and  
6 this Permafrost Research Committee has been in existence  
7 since about 1950, bringing together anyone who is  
8 interested in Canada, and expert in permafrost and  
9 permafrost research for a sharing and pooling of infor-  
10 mation, for the sharing of problems, and for the  
11 stimulation of research, and one of the ways to do  
12 this is to call a meeting and ask anyone who is  
13 interested to come, and the first such Permafrost  
14 Research Conference in Canada was held in 1958. There  
15 have been held since then seven conferences.  
16 I have a list which I can leave, sir, for the record,  
17 going on to 1974. These have been most stimulating.  
18 People come to those meetings, with other men and wo-  
19 men who are concerned with permafrost problems, and  
20 it is in this way that across this country there is a  
21 small group of people who know what permafrost is,  
22 know what the problems are, know where the information  
23 is. One of the productions of this committee quite  
24 recently has been a document that has not yet, I  
25 think, been released, on permafrost terminology, and  
26 you can appreciate, I'm sure, Mr. Commissioner, how  
27 it is essential that those of us who talk about perma-  
28 frost should use the same words in the same way, and  
29 that our Russian friends with whom we keep in such  
30 close touch, should know the English equivalents of

R.F. Legget  
In Chief

1 what they're talking about. So this has been  
2 produced, again I will leave this for the Committee  
3 papers.

4 Then not only on the national  
5 scene but on the international scene from the very  
6 early days this same group have been in touch with  
7 those in the United States concerned with perma-  
8 frost, notably because of Alaska, and particularly  
9 in the Soviet Union, who together in talks with our  
10 friends in the Soviet Union and the United States it  
11 was agreed that in the early '60's, the time had  
12 come for an international conference, not a social  
13 event at all, a hard-working conference on permafrost  
14 problems and solutions. We naturally were expected to host  
15 this conference, but we were too busy with such a  
16 limited staff, I only had five colleagues working on  
17 northern problems, and I'd been told to reduce that  
18 number but I put the telescope to my blind eye and  
19 didn't do it, but we just had five, we were so busy  
20 that we couldn't organize the conference so we asked  
21 our friends in the States if they would do it.  
22 They organized the first conference at Perdue University  
23 in 1970 -- 1963, and with some deference sir, I think  
24 I should mention this, that the two opening statements  
25 of that conference were made by my good friend,  
26 Professor Tsytovich, the chairman of the Russian Nat-  
27 ional Committee on Permafrost, and myself as the  
28 chairman of the Canadian National Committee on Perma-  
29 frost, talking together and sharing our experiences,  
30 in the United States.

R.F. Legget  
In Chief

1 I think this is an indication of what international  
2 co-operation has done.

3 The second international  
4 conference was held in the Soviet Union in 1973;  
5 the third one hopefully will be held in Canada , and  
6 the planning for this is now being done and we hope  
7 that we will have the necessary manpower. This will  
8 give you in brief space, sir, the overall picture that  
9 there is a great deal of information in Canada, and  
10 one of our delights has been to see at each of the  
11 Permafrost Conferences a very large attendance of  
12 our friends from the United States. They do excellent  
13 work in Alaska, we're in touch with that and share,  
14 naturally, all the information that we've got with  
15 all the information that they've got. But perhaps  
16 it will be more surprising to know that exactly the  
17 same thing holds true with regard to the Soviet  
18 Union, and I'm not speaking now of the official dele-  
19 gations that go officially, and the official agreements.  
20 I'm talking of personal friendships and personal visits.

21 I mentioned Professor  
22 Tsytovich, who has been a personal friend of mine for  
23 20 years, and he sends me copies of all his publica-  
24 tions directly from his desk to mine; and I send mine,  
25 such as they are, to him. But more than that,  
26 sir, we have had the two top permafrost experts from  
27 the Soviet Union, Professor Vyalor and Professor  
28 Melnikof, here in Canada for two months as our guests,  
29 and we took them everywhere. They have been to  
30 Inuvik, they looked at Inuvik with pleasure, they

R.F. Legget  
In Chief

1 said, "That's fine, that's just what we do except  
2 that we don't put up such elaborate and such expensive  
3 buildings. How do you get the money for that?"

4 Questions like that. Corres-  
5 pondingly, my colleagues and friends, Dr. Brown and  
6 Mr. Johnston, spent three months in Siberia by  
7 request, and they, too, were shown practically every-  
8 thing. We know what they weren't shown and we know why  
9 not, and they were given the most complete and de-  
10 tailed information of everything the Soviet is  
11 doing, and perhaps to epitomize it, we once had a visit  
12 from the Director of Construction from Krasnoyarsk, which  
13 is one of the cities in the middle of Siberia, it  
14 was when other colleagues were away and so I had the  
15 privilege of talking with him through an interpreter,  
16 we spent a day together, each of us listed the  
17 problems that we met with in northern building.  
18 Each of us then listed the solutions, alternating,  
19 and at the end of the day our problems were identical  
20 and our solutions were identical. I do want to stress  
21 this because there is so much misunderstanding. One  
22 reads that the Russians do this, why can't we?  
23 The reason for the further development in the Soviet  
24 Union, as I'm sure, Mr. Commissioner, you will be  
25 well aware, is that they have industrial mineral  
26 developments and rare mineral developments in Siberia  
27 that we don't have or have not yet discovered. They  
28 have, for example, the biggest diamond mine in the  
29 world, far more valuable than South Africa. They have  
30 gold mines. They have coal in a way that no other

R.F. Legget  
In Chief

1 part of the world has got, and it's for these things  
2 that they have developed towns and buildings in the  
3 north which we could build just as easily if there  
4 was the need for them; but their view about the  
5 northern development is the same as ours. They do  
6 this, they build these developments, they carry out  
7 these constructions only when there is the economic  
8 imperative for it.

9 We have this, as their  
10 solemn assurance. So this is the situation with regard  
11 to the Soviet Union, Canada and United States.

12 To finish with one perhaps  
13 interesting detail, we thought that one of our duties  
14 in passing the information on would be to prepare a  
15 film on northern building, and we got the National  
16 Film Board to do this. It was prepared about ten  
17 years ago, and it's called,

18 "Building in the North."

19 I think perhaps I should say that I was criticized  
20 severely for wasting public money on such a film. It  
21 is a good film, I think, and today, ten years later,  
22 we have six copies and I have told Mr. Morgan, sir,  
23 that I would bring one with me in case you might have  
24 the time and the wish to see it.

25 To my amazement, sir, all  
26 six copies are out on circulation to universities  
27 in Canada and have been all winter, and so I shall  
28 have to use special prerogative to get a copy, but I  
29 will do this, Mr. Commissioner, if I may, in the hope  
30 that perhaps you might see it. It's only 15 minutes.

R.F. Legget  
In Chief

1 It's in color. There are cartoons. There is one mis-  
2 take in it -- oh, the cartoons are not the usual  
3 sort. The cartoon message of indicating what perma-  
4 frost design is, I should hasten to qualify. It's  
5 an entirely respectable film. It's dated, sir, by  
6 showing a steam locomotive rather than a diesel  
7 locomotive, so you know the date on which it was made.

So a pipeline subcommittee was appointed with the full co-operation and hearty co-operation of industry in a way that is such a delight for anybody in the National REsearch Council

1 to experience. It is always the way when the proper  
2 approach is made.

3 This subcommittee saw the  
4 need when the time was ripe for asking if the companies  
5 that had been doing the research in the north  
6 preparatory to the preparation of the pipeline sub-  
7 missions would be willing to say in public what they  
8 had been doing. We were told that this would be  
9 done and so the first presentations of research work  
10 preparatory to the pipeline submissions were given at  
11 the pipeline conference, the proceedings for which,  
12 sir, are here, you know them I am sure.

13 This was a meeting that we  
14 planned with diffidence as one always does. We thought  
15 if we got 300 we would be lucky. We had 600 and  
16 when I say that we had an audience of 500 to the  
17 last minute of the last session, you will realize  
18 that it was a significant meeting in more ways than  
19 one and this book contains the first statements of  
20 the research work which I do hope will be of assistance  
21 in the further developments of the studies now being  
22 made.

23 One delight was that six of  
24 the 600 came from the Soviet Union headed by the  
25 deputy minister for the oil industry who came over  
26 specially with his senior aids. I had a delightful  
27 talk with him and he told me, through an interpreter,  
28 because unfortunately I do not speak Russian and he  
29 did not speak Canadian, that he told me that he had  
30 to come to Ottawa to find out what they had been doing

1 because his colleagues had got together a paper which  
2 they gave us telling what they had been doing, but  
3 he said that the entire trip had been more than worth-  
4 while for what he had learned about what' we were doing  
5 and so here again is the same thing.

6 Then after that there  
7 has been mentioned to you already, sir, another  
8 meeting, but I thought that I should mention it to.  
9 The one at Mount Gabriel, the proceedings for which  
10 are in this elegant blue book. This is "Science of  
11 the North" and again, the six basic papers in this  
12 book and the discussions I trust may be helpful  
13 but they do indicate the widespread interest and the  
14 acceptance of problems in the north but with the  
15 acknowledgment that the problems can be met if people  
16 will go for the information, and this, sir, I will  
17 if you will permit me, make my one repetition, because  
18 so much work has been carried out in the north by  
19 those with the best of intentions, with expert technical  
20 skills in building, in civil engineering, in construction  
21 and architecture who just did not take the final  
22 step in asking what other people knew of the area in  
23 which they were going to build. There is for example  
24 an example far from here of a new town plan that  
25 was developed, a beautiful plan, and today is a  
26 splendid town, but it happened to be on the southern  
27 limit of permafrost and the designers did not know  
28 that. If they had put a telephone call through to  
29 Ottawa, the location could have been spotted on an  
30 aerial photograph, so for the cost of perhaps \$3.00

1 they could have found they were on the edge of perma-  
2 frost, but they did not.

3 There have been construction  
4 operations in the far north carried out by people  
5 who were expert construction men in the south of  
6 CAanda who thought that in the north they could apply  
7 the same methods, but you cannot, and so with your permi-  
8 ssion, Mr. Commissioner, I would like to quote just  
9 one thing from the Mount Gabriel seminar.

10 There was a working group  
11 there considering the paper on technology consisting  
12 of really perhaps the most expert group that one  
13 could select from the whole of Canada of those who  
14 know the north, who know the problems and who  
15 know what must be done and their unanimous decision  
16 was that they would recommend this: "that the  
17 group urges that prequalification of all designers  
18 of publically financed buildings and structures for  
19 the far north and of all contractors for publically  
20 financed northern work be mandatory." In other words,  
21 that no designs and no construction be carried out for  
22 the north of CANada except by those who know and  
23 can prove that they know what the problems are and that  
24 they know where the information is and if that  
25 requirement had been in vogue earlier, such problems  
26 as have arisen and have created unfortunately in  
27 some places and in some cases wrong impressions about  
28 building in the north, these could have been avoided  
29 and this points finally, Mr. Commissioner, to  
30 the need for making sure that this does not happen

1 in the future and this means training, and here we  
2 are up against a difficulty because there are  
3 problems in the rest of Canada that require more  
4 than the manpower we have available and so the  
5 manpower available for the special technical work of  
6 the north is limited, but there is, and it is a  
7 privilege to say this, training on northern problems  
8 now being given to engineers at Universities of  
9 Alberta, the University of Waterloo and Ecole Polytechnique  
10 in Montreal. There may be others and if there are,  
11 and I'm omitting them I apologise, but to my knowledge,  
12 these are the three where regular instruction as  
13 an introduction only to northern problems is given  
14 to undergraduate engineers, but this of course is  
15 just a beginning and because of the needs and because  
16 of the eminent desirability of this prequalification  
17 which means pretraining being made mandatory as I hope  
18 to see, there will be the need for training on a scale  
19 that has not perhaps yet been fully realized for any  
20 of the great construction that is to be carried out  
21 in northern Canada, if and when that takes place,  
22 and this -- and I speak particularly with regard to  
23 engineering, because the engineers in their normal  
24 training do not get the necessary information.  
25 It is there, they have to be introduced to sources,  
26 they have to be introduced to the need for any in-  
27 formation that they gain in the <sup>being</sup> north put into the  
28 common pile for the common good, and this is a  
29 training program that cannot be hurriedly done.  
30

Now, it is not for me,

1 Mr. Commissioner, to say perhaps more than that,  
2 except that this is not a matter of planning a short  
3 few days course that can be arranged quickly.. I  
4 visualize something much more important than  
5 that for <sup>any</sup>major construction operation, and <sup>when</sup>I say that  
6 of course one thinks of a possible pipeline that is  
7 to be built in the north.

8 Correspondingly with regard  
9 to training construction workers, here to is a  
10 problem. Because skilled workers are going to be  
11 needed. There will be few northerners available  
12 from other jobs to do this and so my hope is that  
13 we shall see, if I may presume, with your permission  
14 to voice just one or two opinions in conclusion.

15 I hope that we shall see a  
16 our northern fellow Canadians trained not so much in  
17 the construction techniques, but in the operation of  
18 such facilities as are built, such as pipelines, if  
19 they are built, so that they can continue to operate  
20 them after the construction crews have disappeared;  
21 and I say that because, again, and I am now drawing  
22 all that I have said, sir, to a conclusion, and  
23 I speak now as an engineer, <sup>because my picture</sup> /-- as an engineer of  
24 the future of the north, is the pipeline perhaps, if  
25 it is so decided by yourself, sir, by the Government  
26 of Canada, for gas and possibly for oil, to utilize  
27 the resources that nature has given us, the develop-  
28 ment of mines, further mines, and the necessary rail  
29 facilities, necessary to supplement the Mackenzie  
30 system when they are discovered, but beyond that I

R.F. Legget  
In Chief

1 see the future of the north as the Government of  
2 Canada itself has stated in its second major guideline:  
3 the conservation and enhancement of the natural  
4 environment and may I stress that it is an engineer  
5 that is saying this because my view of the north is  
6 we must protect it. For reasons that I hope  
7 that I have made clear it is one of the most fragile  
8 environments in the entire world. The environment  
9 can be utilized for public good and for commercial  
10 purposes with proper planning. Planning on a  
11 scale that this country has probably never seen,  
12 with the greatest care by manpower properly trained and  
13 properly skilled, affecting only a minute fraction of  
14 one degree of the total vast area that constitutes  
15 this marvelous, most marvelous of all natural areas  
16 in the world and I want as a Canadian and as an  
17 engineer and as a lover of the North to see it  
18 so preserved, consistent with the public good.

19 Sir, I thank you very much  
20 for your hearing. If I can answer any questions,  
21 I am at your service.

22 THE COMMISSIONER: Thank you  
23 very much, Dr. Legget. We are gratefully in your  
24 debt for coming here as one of Canada's great  
25 authorities in this field and giving us the benefit  
26 of your enormous knowledge and experience. I think  
27 that I will turn to Mr. Scott for further guidance at  
28 this point.

(WITNESS ASIDE)

29 MR. SCOTT: Mr. Commissioner,  
30 I am going to ask Mr. Morgan if he will review the

1 material to which Dr. Legget referred, he had some  
2 of it, I just want to ascertain that we have all of  
3 it, whether we have absorbed it is a question that  
4 will begin to appear later in the Inquiry.

5 THE COMMISSIONER: I must  
6 say, Mr. Scott, that I should like Dr. Legget's paper  
7 on northern construction prepared in 1940 to be marked  
8 as an exhibit, the paper relating to the plan for the  
9 new Aklavik, the permafrost map which Dr. McKay showed  
10 us in slide form, but just in case it was not the  
11 same one, the building code for the north, the  
12 committee meetings and the film. We already have,  
13 Dr. Legget, read and felt to absorb the material and  
14 the publications relating -- coming out of the pipeline  
15 conference and of course in science of the north  
16 and we will be rereading that material as we go  
17 along. I think I should also say, Mr. Scott,  
18 that since Dr. Legget is the last overview witness,  
19 the Inquiry intends -- that is, as a gesture of  
20 appreciation to those who gave evidence on the overview  
21 to present them with the volumes of overview evidence  
22 and the slides when they have been completed in a  
23 form that will be suitable and I think that I should  
24 say that the Inquiry appreciates the help that all  
25 of the overview witnesses have given to us.

26 MR. SCOTT: I take it, Mr.  
27 Commissioner, that our general object will be to  
28 mark the appropriate documents on Monday when it will  
29 be marked with some others with exhibit numbers --  
30 or Tuesday, rather, and generally to assure that

1 Dr. Legget goes back to Ottawa empty handed,  
2 where possible.

3 May I suggest, sir, that we  
4 should, -- this being the last overview witness --  
5 that we should adjourn until Tuesday at nine  
6 o'clock.

7 THE COMMISSIONER: Tuesday  
8 at nine o'clock.

9 (PROCEEDINGS ADJOURNED UNTIL MARCH 11, 1975)

## MACKENZIE VALLEY PIPELINE INQUIRY

IN THE MATTER OF AN APPLICATION BY CANADIAN ARCTIC  
GAS PIPELINE LIMITED FOR A RIGHT-OF-WAY THAT MIGHT  
BE GRANTED ACROSS CROWN LANDS WITHIN THE YUKON  
TERRITORY AND THE NORTHWEST TERRITORIES FOR THE  
PURPOSE OF THE PROPOSED MACKENZIE VALLEY PIPELINE

and

IN THE MATTER OF THE SOCIAL, ENVIRONMENTAL AND  
ECONOMIC IMPACT REGIONALLY OF THE CONSTRUCTION,  
OPERATION AND SUBSEQUENT ABANDONMENT OF THE ABOVE  
PROPOSED PIPELINE.

(Before the Honourable Mr. Justice Berger, Commissioner)

Yellowknife, N.W.T.

March 11, 1975.

1 Yellowknife, N.W.T.

2 March 11, 1975.

3 (PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

4 MR. SCOTT: I have no more  
5 overview witnesses, Mr. Commissioner.

6 I felt at opening this morning  
7 I had an obligation, in view of my undertaking to you  
8 to report to you and the other participants about  
9 Commission counsel's meeting with the officials of the  
10 Department of the Environment in Edmonton, which arose,  
11 of course, out of the conversation and correspondence  
12 with the Minister, which has already been referred to  
13 in the evidence.

14 On Sunday last, March 9th,  
15 Mr. Goudge, Dr. Fyles and I met in Edmonton with  
16 representatives of the Department of the Environment,  
17 including John Tenor, the Assistant Deputy Minister  
18 of the Department, and Charles Alexander, counsel for  
19 the Department, and a number of other senior officials  
20 The purpose of this meeting, of course, was to discuss  
21 ways by which the offer of co-operation to the Inquiry  
22 and its participants that the Minister had made last  
23 week could be effected expeditiously. The discussion  
24 and its resolution can really be dealt with under about  
25 six headings.

26 In the first place, the  
27 Department of the Environm ent confirmed for us that  
28 in compliance with your ruling, the list of Department  
29 of Environment reports and studies which had been  
30 filed by the Government of Canada through me, included

1 on it all unpublished reports or studies that were  
2 relevant and that had been prepared by or for the  
3 Department of the Environment. So first of all, we  
4 obtained an assurance from senior officials of the  
5 Department ~~that~~ insofar as unpublished reports and  
6 studies were concerned, the list was complete.

7 The second major matter  
8 considered was that the Department of the Environment  
9 in preparing its list of reports and studies had con-  
10 cluded -- I think not unnaturally -- that the purpose  
11 of that requirement of the Inquiry was to assure that  
12 complete disclosure should be made of reports and  
13 studies to all participants. They had not, therefore,  
14 and were not able to assure us that the list filed,  
15 set out all published reports and studies, and the  
16 officials of the Department indicated --

17 THE COMMISSIONER: Excuse  
18 me, Mr. Scott; Mr. Waddell, leave that door open, this  
19 is a public hearing and it should be open. Everybody  
20 bangs it when they enter or they leave.

21 MR. SCOTT: Therefore there  
22 was some grave doubt that the list would not be complete  
23 insofar as published reports and studies were concerned,  
24 though those reports and studies would be available  
25 generally to the public in libraries, research centres,  
26 and at the Queen's Printer. However, as a positive  
27 act of co-operation and to assist the participants in  
28 their research work, the Department of the Environment  
29 undertook to prepare immediately a complete list of  
30 all published reports and studies prepared by or for

1 the Department from January 1, 1970 up until the present.  
2 They undertook to give this matter some priority, and  
3 advised that that list would be available within the  
4 next three or four weeks. I emphasize, of course, that  
5 these documents would normally be available to parti-  
6 cipants in their research work anyway through libraries  
7 and other facilities.

8 The third matter, as an  
9 affirmative act of co-operation with the Inquiry, the  
10 Department of the Environment proposed to make avail-  
11 able a copy of each unpublished report or study at  
12 Yellowknife. The procedure will be that when the Depart-  
13 ment can collect these unpublished reports and studies  
14 from their own files, they will be delivered to the  
15 Inquiry Offices at Yellowknife and we will develop a  
16 convenient system so that participants or others can  
17 inspect them at the Inquiry offices or copy them, if  
18 that is manageable, or in some cases borrow them  
19 under specific terms; so that the Department of the  
20 Environment went this far, that instead of requiring  
21 participants to go to Edmonton or Ottawa to see the  
22 unpublished material, they would undertake as an act  
23 of co-operation to make it available here in our lib-  
24 rary. The Department only wishes to emphasize that  
25 this unpublished material is made available to the  
26 Inquiry for the purposes of the Inquiry only, and for  
27 no other purpose.

28 The fourth matter is the  
29 matter to which Mr. Anthony particularly directed him-  
30 self, perhaps, and that is the question of participants

1 consulting with officials with the Department of the  
2 Environment.

1                   The Department advised us  
2     that it was anxious to ensure that each participant  
3     would have the opportunity if it desired to inter-  
4     view and consult with any official of the Depart-  
5     ment wherever he may be. Because, however, it was  
6     desirable that there should be some control of  
7     time allocation, these persons, and because they are  
8     not all physically available in convenient centres  
9     such as Ottawa and Edmonton, the following routine  
10    was proposed and is acceptable to Commission  
11    Counsel.

12                   In the first place, the  
13    participant will make a personal arrangement with  
14    the official with whom he wishes to consult and  
15    provide notification that that arrangement has  
16    been made to Mr. Jack Etoch whose address I will  
17    provide later, but who is a senior official of the  
18    department at Edmonton.

19                   The purpose of that notifica-  
20    tion is simply so that Mr. Etoch will have some  
21    knowledge of what his various officials and the  
22    other officials of the Department are doing.

23                   So in the first place the  
24    participant will make a personal arrangement for in-  
25    terview or consultation directly with the official  
26    concerned.

27                   In the second place par-  
28    ticipants -- it is expected -- will not invite or  
29    require officials in the Department of the Environ-  
30    ment to perform research or other work, but will

1 utilize this Opportunity for the purposes of in-  
2 terviewing them, obtaining their knowledge and con-  
3 sulting with them.  
4

5 In the third place, in the  
6 event that a participant is not certain which official  
7 he wishes to consult or in the event that the official  
8 is in a remote part of Canada, and interestingly  
9 enough, the example given for an Easterner, an  
10 odd one, was that New Brunswick was a remote part of  
11 Canada, and therefore that person is not easily  
12 available, the participant will make arrangements for  
13 that consultation directly with Mr. Etoch and all  
14 possible steps will be taken to see that the official  
15 of the Department is made available at a time and  
16 place that is convenient both to the participant and  
17 to him.

18 In the fourth place, parti-  
19 cipants will provide to Commission Counsel from time  
20 to time either before or after the event a list of  
21 persons in the Department with whom they have consulted.

22 In the fifth place, the  
23 Department wishes to emphasize that informal consulta-  
24 tion will be permitted and encouraged by telephone,  
25 for example, rather than by interview, as long as the  
26 fact of that consultation is communicated to Mr.  
27 Etoch and to Commission Counsel, either before or after  
28 the event.

29 Now, Mr. Commissioner, I  
30 think therefore, that in summary what can be said is  
that subject to physical availability and time

1 availability, any participant is now entitled to  
2 consult and interview any official of the Department,  
3 subject to those very modest restrictions that I have  
4 set out and it seems to me that there is no reason  
5 why, if that process is desired, it cannot begin immed-  
6 iately.

7 The next matter has to do with  
8 witnesses. The Department of the Environment indi-  
9 cated and confirmed the matter that Madame Sauve  
10 had set out in her letter to the Commission and that  
11 is that if participants wish officials of the Dep-  
12 artment to give evidence, they may make the normal  
13 arrangements that your rules contemplate for the  
14 calling of witnesses. I think it was made clear  
15 to us, that for example, if a participant wishes  
16 to call a certain official, he has simply to notify  
17 that official and to notify Mr. Etoch and arrangements  
18 will be made on the basis we outlined the other  
19 day relating to all government witnesses, in which  
20 he can be made available here to give evidence.

21 Again, because some of these  
22 persons may be remote from Yellowknife, it is desir-  
23 able that participants give as much time, as much  
24 lead time to the potential witnesses as they can.

25 The sixth matter and again  
26 another matter that Mr. Anthony specifically referred  
27 to, relates to memoranda made in the Department with  
28 respect to preparation for a proposed intervention by  
29 the Department. We were advised that  
30

1 in consideration of a proposed intervention in  
2 this INquiry by the Department of the Environment,  
3 the Department had set up an informal task force  
4 which was engaged, conducting a review of the application  
5 and a review of the Government assessment group's  
6 report and a request for supplementary information  
7 and the applicant's replies.

8. The Chairman of the Task  
9 force has -- is in the course of making a report,  
10 isolating certain areas of concern which developed.  
11 That report is not yet available but we have been  
12 provided with two documents, first of all, a digest  
13 of the material that will be contained in that  
14 report and in the second place, a list of witnesses  
15 prepared by the Department task force, setting out  
16 names of people, both within and without the Department,  
17 who it was thought had expertise that might bear  
18 on the areas concerned. WE have had copies of that  
19 material made and it is available and will be  
20 circulated to every participant today.

21 When the more formal report  
22 of the Department is available, it will, of course,  
23 be provided, but I think that it is safe to say that  
24 the digest is a complete and full synopsis of the  
25 material that will be contained in that report.

26 Therefore, Mr. Commissioner,  
27 I think that we are able to report that as a result  
28 of Madame Sauve's letter and our meeting on Sunday,  
29 the Department of the Environment has exhibited, if  
30 I may say this, a very, very high level of

1 co-operation with the Inquiry and a scheme has been  
2 developed, whereby the promise of the Department  
3 that it would open all doors is being realized and I  
4 particularly am grateful to Dr. Tener and his  
5 officials for the dispatch with which they responded  
6 to the Inquiry's concern in these areas. It need  
7 hardly be said that there may be, from time to time,  
8 particular difficulties relating to the whereabouts  
9 of a particular official or such matters. The  
10 Department wishes to emphasize that it will take  
11 all reasonable steps, with all dispatch, to dissolve  
12 those and it seems to me that if they occur from  
13 time to time, if they come to the attention of the  
14 participants from time to time, it would be a happy  
15 start if they could bring those difficulties to our  
16 attention first and we will attempt to use our good  
17 offices to iron them out.

18 Again, I simply want to say  
19 that I am grateful for what I think is a very high  
20 standard of co-operation and openness that the  
21 Department has proposed by these suggestions. I  
22 think that that is all I have to say at this stage,  
23 sir. That material will be circulated today to the  
24 participants.

25 MR. GENEST: May it please  
26 you, Mr. Commissioner, after being absent from your  
27 hearings for a few days and reading what went on after  
28 I left, I might be permitted to say that we are now  
29 going to start the non-controversial part of the hear-  
30 ings.

1 Before beginning, sir, I  
2 wonder if it would be convenient. I have proposed to  
3 my learned friend, Mr. Scott, and those of the parti-  
4 cipants who I could see yesterday that it might  
5 be convenient to the Inquiry if we filed at this  
6 time in view of exhibit numbers, subject to whatever  
7 requiremants of proof may be imposed, the basic  
8 documents on which the application is based, that is,  
9 the various exhibits to the application. The  
10 application to the Minister for a grant of right-of-  
11 way was of course filed at the preliminary hearings and  
12 was given the number Exhibit 3, and I wonder if I  
13 might be permitted to file the supporting exhibits  
14 which will be referred to throughout the evidence  
15 of Arctic Gas during these many months and it might  
16 be more convenient if I did it all in a block this  
17 morning and identified the documents. Would that  
18 be satisfactory, sir?

19 THE COMMISSIONER:: Yes.

20 I think it would be, if no one has a better proposal.

21 MR. GENEST: I have provided  
22 the -- is it the Registrar Staff, sir -- the  
23 Commission- Secretariat with the documents that I  
24 propose to file and they are as follows:

25 The first will be a volume  
26 containing application materials with reference  
27 to location, design and facilities of capacities. It  
28 covers Sections 8 and 9 -- It is not the facilities--  
29 of capacities, I am told that it is the capacity of  
30 the facilities.

1 I do not know how we  
2 want to proceed, sir. Do we give these each an indi-  
3 vidual exhibit number?

4 THE COMMISSIONER: I would think  
5 we ought to -- Mr. Scott, you assist us, if you think  
6 we are on the wrong track?

7 MR. SCOTT: I think we should,  
8 Mr. Commissioner. It would be easier.

9 MR. GENEST: And the last  
10 exhibit according to the list supplied to me by Mr.  
11 Waddell was exhibit 48 which was a submission by  
12 the Northwest Territories Chamber of Commerce.  
13 So I do not know if you want to start over. I thin k  
14 perhaps -- I think we agreed that to save confusion we  
15 should just keep on going in numerical order.

16 THE COMMISSIONER: I think  
17 Mr. Waddell -- has an addendum there.

18 MR. GENEST: Five more Mr.  
19 Waddell says, so 48 plus five is 53. This should then  
20 be 54.

21 (VOLUME WITH REFERENCE TO LOCATION, DESIGN AND CAPACI-  
22 TY OF FACILITIES MARKED AS EXHIBIT NO. 54.)

23 MR. GENEST: The next exhibit,  
24 sir, is a volume entitled Construction Plan Operations  
25 and Maintenance Plans which covers Sections 13 (a)  
26 and 13 (b) of the application materials and that  
27 will be Exhibit 55.

28 (VOLUME ENTITLED "CONSTRUCTION PLAN OPERATIONS AND  
29 MAINTENANCE PLANS MARKED AS EXHIBIT NO. 55.)  
30

1 MR. GENEST: The next volume  
2 is a volume entitled "Regional Socio-Economic Impact  
3 Statement" covering Section 14 (c) of the application  
4 and with your leave, sir, that would be Exhibit 56.  
5 (VOLUME ENTITLED "REGIONAL SOCIO-ECONOMIC IMPACT  
6 STATEMENT" MARKED AS EXHIBIT NO. 56.)  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

1 MR. GENEST: The next is the  
2 applicant's environmental statement, north of the 60th  
3 Parallel covering Section 14-(b)(n), and that will be  
4 Exhibit 57.

5 (APPLICANT'S ENVIRONMENT STATEMENT NORTH OF  
6 60th PARALLEL MARKED EXHIBIT 57)

7 MR. GENEST: The next is the  
8 volume entitled:

9 "Northerner Training Program,"  
10 and this covers Section 14(x) of the application  
11 materials. That will be Exhibit 58)

12 (NORTHERNER TRAINING PROGRAM MARKED EXHIBIT 58)

13 MR. GENEST: The next is  
14 Exhibit 59, a volume covering alternative corridors  
15 governing section 14(e) of the application materials,  
16 which will be No. 59.

17 (ALTERNATIVE CORRIDORS VOLUME MARKED EXHIBIT 59)

18 MR. GENEST: And following  
19 which is a companion volume which contains alternative  
20 corridor drawings covering Section 14(e)(i)-(x) of the  
21 application materials.

22 (ALTERNATIVE CORRIDOR DRAWINGS VOLUME MARKED  
23 EXHIBIT 60)

24 MR. GENEST: Then there are  
25 a series of exhibits covering design drawings and  
26 alignment sheets, the first of which would be a  
27 very unwieldy document entitled:

28 "Design drawings, Section 8(b)(c) and flow  
29 diagrams, Section 8(b)(iv)."

30 (DESIGN DRAWINGS & ALIGNMENT SHEETS MARKED

1 (EXHIBIT 61)

2 MR. GENEST: Then there is  
3 alignment sheets showing the detail of the pipeline  
4 materials -- what was the last number? The former  
5 document, the design drawings was No. 61; and the next  
6 one will be an alignment sheet showing the detail of  
7 a pipeline route north of the 60th Parallel.

8 (ALIGNMENT SHEET SHOWING DETAIL OF PIPELINE NORTH  
9 OF 60th PARALLEL MARKED EXHIBIT 62)

10 MR. GENEST: Then another  
11 alignment sheet for the interior route entitled:  
12 "Alignment sheets and full diagrams, interior  
13 alternative pipeline route, Prudhoe Bay to  
14 Travaillant Lake junction via the main branch  
15 of the Canning River."

16 (ALIGNMENT SHEET FOR INTERIOR ROUTE MARKED  
17 EXHIBIT 63)

18 MR. GENEST: And a similar  
19 document covering the same ground except it's via  
20 the Marsh Fork of the Canning River.

21 (ALIGNMENT SHEET VIA MARSH FORK OF CANNING  
22 RIVER MARKED EXHIBIT 64)

23 MR. GENEST: Then, sir, there  
24 is an amendment to the application to the Minister  
25 himself entitled:

26 "The first amendment to the application to  
27 the Department of Indian Affairs & Northern  
28 Development,"  
29 which deals, sir, with the route change in the Fort  
30 Simpson area.

1 (FIRST AMENDMENT TO APPLICATION MARKED EXHIBIT 65)

2 MR. GENEST: That will be No.

3 65. Then there is a companion volume to that, really  
4 two, there is an amendment to the information given  
5 in the Sections 8-A, 8-B, 13-A and 14-D. Perhaps we  
6 can entitle that an exhibit in support of the Fort  
7 Simpson amendment, which will be No. 66.

8 (VOLUME RE FORT SIMPSON AMENDMENT MARKED EXHIBIT  
9 66)

10 MR. GENEST: And there is an  
11 alignment sheet also relating to the Fort Simpson  
12 amendment, and in the same document is an amendment  
13 to the design drawings with reference to the alignment  
14 sheet.

15 (ALIGNMENT SHEET RE FORT SIMPSON AMENDMENT &  
16 AMENDMENT TO DESIGN DRAWINGS MARKED EXHIBIT 67)

17 MR. GENEST: And then, sir, I  
18 understood counsel was going to be filing the  
19 Mackenzie Valley Pipeline assessment prepared by the  
20 Pipeline Application Assessment Group, otherwise known  
21 as PAAG, and the government's Assessment Group, other-  
22 wise known as GAG. I would think they would prefer  
23 the first.

24 MR. SCOTT: I presume, Mr.  
25 Genest, we've heard the end of that rather tired  
26 joke by now.

27 MR. GENEST: I wasn't sure.  
28 I thought I'd have my crack at it and then it will  
29 never be heard again.

30 MR. SCOTT: It might be

1 convenient to give, if you are finished with your  
2 primary filings, if you --

3 MR. GENEST: Well, I was going  
4 to file our response.

5 MR. SCOTT: Well, why don't  
6 we, in chronology why don't we file the requests for  
7 supplementary information first, and that's called

8 "Requests for supplementary information concern-  
9 ing Canadian Arctic Gas Pipeline Limited."

10 Could it be given, Mr. Commissioner, the next exhibit  
11 number, which is 68?

12 (REQUESTS FOR SUPPLEMENTARY INFORMATION RE  
13 CANADIAN ARCTIC GAS PIPELINE LTD. MARKED EXHIBIT  
14 68)

15 MR. SCOTT: Then Mr. Genest  
16 perhaps will file the replies which are contained in  
17 a brown volume.

18 MR. GENEST: Well, if we are  
19 going to go by the strict order of chronology, the  
20 report came before the replies.

21 MR. SCOTT: All right, Mr.  
22 Genest. No. 69 then, Mr. Commissioner, should be  
23 the report of the Pipeline Application Assessment  
24 Group, entitled:

25 "Mackenzie Valley Pipeline Assessment,"  
26 which is the document with the handsome cover.

27 (MACKENZIE VALLEY PIPELINE ASSESSMENT MARKED  
28 EXHIBIT 69)

29 MR. SCOTT: And No. 70 should  
30 be the replies of Arctic Gas to the requests for

1 supplementary information, which is entitled:

2 "Responses to Pipeline Application Assessment  
3 Group Requests for Supplementary Information,"  
4 and is the brown volume. It might be convenient at  
5 this time also to give the next exhibit number to a  
6 document entitled:

7 "An Index to the application of Canadian  
8 Arctic Gas Pipeline Limited with particular  
9 reference to environmental and technical  
10 topics."

11 That index was prepared by the Pipeline Application  
12 Assessment Group. What number is that?

13 MR. GENEST: 71.

14 MR. SCOTT: And that, I think,  
15 should be Exhibit No. 71.

16 (REPONSES TO PAAG REQUESTS FOR SUPPLEMENTARY  
17 INFORMATION MARKED EXHIBIT 70)

18 (INDEX TO APPLICATION MARKED EXHIBIT 71)

19 MR. SCOTT: All those are  
20 filed, so far as we're concerned, subject to the  
21 required proof.

22 MR. ANTHONY: Mr. Commissioner,  
23 may I just direct a question to Mr. Genest? My under-  
24 standing of Exhibit 3, the application, is in fact the  
25 thin application volume. We now have further exhibits  
26 as outlined by Mr. Genest, and I was wondering whether  
27 it was the intention of Arctic Gas to also file Sections  
28 4, 5, and 6 which were filed with the N.E.B. as part  
29 of the application, but have not as yet been filed  
30 before this Commission?

1 MR. GENEST: Well, sir, my  
2 intentions are subject to change from time to time,  
3 but at the present it's not my intention to file these  
4 because my present belief, which may be based on an  
5 ignorance of some of the issues involved, is that they  
6 are not relevant to the concerns with which -- with the  
7 investigation with which you are charged.

8 MR. ANTHONY: Mr. Commissioner,  
9 if I may then make the request of Arctic Gas that  
10 this information be filed? In Section 8(a).3 they  
11 discussed the questions generally of gas supply area,  
12 as it relates to routing in particular, and they talk  
13 about expected supply and flow-through and expected  
14 capacity, and I think those are covered in Section 4,  
15 entitled:

16 "Gas supply areas,"  
17 Section 5, "Gas supply reserves," and  
18 Section 6, "Gas supply deliverability."

19 I think it may be helpful if that was before us, even  
20 though the exact issue may not be subject to detailed  
21 consideration.  
22  
23  
24  
25  
26  
27  
28  
29  
30

1 THE COMMISSIONER: May I make  
2 a suggestion, Mr. Genest, so we don't get bogged down  
3 in an argument. Why don't you file them and have them  
4 marked, reserving your right to take the view that  
5 not everything in them is necessarily relevant?

6 MR. GENEST: That was my  
7 that will be quite satisfactory.  
8 concern, sir,/ I don't think I have them here today,  
9 but they will be put in in due course.

10 MR. GIBBS: Mr. Commissioner,  
11 along the lines of what Mr. Anthony has said, in my  
12 submission there are at least two other documents that  
13 fall into that category of material, and which my friend,  
14 Mr. Genest, may not want to file but which in my sub-  
15 mission is relevant to this hearing. One is the  
16 financing of the project and I suggest to you, sir,  
17 that it is relevant because you're directed to con-  
18 sider the social and economic impact regionally and  
19 of course an impact on Canada must be reflected within  
20 its regions.

21 There is a second reason, sir,  
22 and that is that part of the financial material is the cost  
23 of service, and the cost of service must apply to  
24 the service to northern communities, so in my submiss-  
25 ion that finance volume ought to be filed, and as  
26 well my recollection, Sir, is that there is one dealing  
27 with the impact on the Canadian economy and for the  
28 same reasons, because that is reflected regionally,  
29 in my submission that also ought to be filed by  
30 Canadian Arctic Gas.

THE COMMISSIONER; Well,

1 Mr. Genest, why don't you file all of those on the  
2 same footing?

3 MR. GENEST: I wouldn't like  
4 it to be taken by filing them that we agree at all  
5 with Mr. Gibbs' position which seems to be directed  
6 at just having two National Energy Board applications,  
7 a dry run here and one down in Ottawa. But I'll  
8 accept that suggestion, sir, reserving my rights.

9 THE COMMISSIONER: I should  
10 say that all of the material that Arctic Gas filed  
11 with the National Energy Board in support of its  
12 application with the National Energy Board was filed  
13 concurrently with the Minister of Indian Affairs &  
14 Northern Development, and all of it was turned over  
15 to the Inquiry by the Minister, and the additions to  
16 the material have been sent directly to the Inquiry  
17 since, by Arctic Gas. I'm speaking of the formal volumes  
18 that it seems to me are under discussion here this  
19 morning.

20 MR. GENEST: Sir, I believe  
21 that as far as the documents filed in support of the  
22 application to the Minister they are identified in Schedule  
23 "A" to the application, which is Exhibit 3 in these  
24 proceedings, and it does not contain the documents  
25 referred to by my learned friends this morning. What  
26 was placed before the Minister in support of the  
27 application for a grant of right-of-way are the docu-  
28 ments that I filed today, plus of course the amendments  
29 that I filed today.

30 THE COMMISSIONER: Well --

1 MR. GENEST: The other  
2 documents may have been provided, but they were as a  
3 matter of information.

4 I may be quibbling, and -- but  
5 there will come a time when it will be more than a  
6 quibble because it seems to me, sir, that we have to  
7 keep the concerns of this Inquiry in proportion, and  
8 that you could spend months examining eco subjects which  
9 will be exhaustively examined by the National Energy  
10 Board. But I will arrange to have these here, reserv-  
11 ing my rights.

12 MR. SCOTT: And I presume,  
13 Mr. Commissioner, that reserving Mr. Genest's rights  
14 they will be given exhibit numbers when they're made  
15 available?

16 MR. GENEST: Mr. Commissioner,  
17 I wonder if I could reserve on that question? It  
18 affects other hearings. I undertake to deal with it  
19 first thing tomorrow morning, if that's -- I would  
20 not like to be pinned down at this moment. There may  
21 be a consequence of my filing an exhibit that I've  
22 estopped myself or foreclosed myself. I would like  
23 to consider my position in that respect. These docu-  
24 ments are, of course, available and can be used by  
25 any party in cross-examination; but I certainly don't  
26 propose to make them part of my case. I thought the  
27 exercise of filing exhibits were those documents upon  
28 which I was relying in support of the evidence I was  
29 adducing before these hearings, so I am not prepared  
30 at this time to give an undertaking that I will file

1       them as my exhibits. I'll make them available, I'm  
2       prepared to go that far.

3                       THE COMMISSIONER: Mr. Genest,  
4       I think I should say that last year in April and in  
5       May, I held Preliminary Hearings in Yellowknife, Inuvik,  
6       Whitehorse, and Ottawa, in which there was a great  
7       deal said on every side about the scope of this Inquiry's  
8       work and I laid down rulings that were designed to  
9       limit, generally, the scope of this Inquiry, and I think  
10      that all counsel have studied those rulings and I hope  
11      that in embarking upon the consideration of the evi-  
12      dence all counsel will bear those rulings in mind be-  
13      cause I don't think there's anything to be gained by  
14      threshing all of those questions out again.

15                     MR. GENEST: Well, sir, I  
16      certainly didn't want to be taken -- I want to say I  
17      read your rulings every night before I go to bed and  
18      discover something new.

19                     THE COMMISSIONER: They  
20      would put you to sleep, I suppose.

21                     MR. GENEST: I certainly  
22      appreciate the scope of the Inquiry. I appreciate  
23      also that while some subjects impinge, you have  
24      faced broad limits and I certainly do not want to  
25      argue that matter again. Perhaps my concerns that  
26      I have this morning will all go away this afternoon  
27      and tomorrow you will get exhibits.

28                     I would just like to have a  
29      little time to consider that.

30                     THE COMMISSIONER: By all means.

1 MR. SCOTT: Mr. Commissioner,  
2 before Mr. Genest begins, could I raise one matter  
3 that I think should be dealt with generally? Mr.  
4 Genest has now filed the summaries that are required  
5 by the rulings with respect to Panels 1 and Panels 2.

6 MR. GENEST: Panel 3 this  
7 morning.

8 MR. SCOTT: Well, I don't seem  
9 to have run across it yet and I want to deal just with  
10 Panel 1 and Panel 2.

11 We will learn as we go along,  
12 I've no doubt that these summaries are full and complete  
13 summaries of the evidence that will be given but I am  
14 concerned about one point, dealing with Panel 1 on  
15 page 14, the summary provides as follows:

16 "The panel will be asked to review the concerns  
17 raised by the Government Assessment Group Report  
18 and the response of the panel to such concerns."

19 I am not at the moment satisfied, Mr. Commissioner,  
20 that that is a summary of the evidence that will be  
21 dealt with under that head. I would have thought, and  
22 I've no doubt it may be possible to do it in subsequent  
23 panels, that if such a subject is to be dealt with,  
24 the applicant in his summary will be able to give us  
25 a reference to the paragraphs in the Assessment Group  
26 Report, or in the replies for supplementary information,  
27 and a reference to the paragraphs in the Arctic Gas  
28 Replies so that we may narrow down and know a little  
29 more precisely the matters that the applicant proposes  
30 to deal with in that area in each panel. I think also

1 it would be helpful if in the summaries, the applicant  
2 were to set out whether his response to the Assessment  
3 Group's enquiry, if that it be, in any given case, will  
4 go beyond the response that is set out in the replies  
5 of Arctic Gas. So that applicants will not be con-  
6 fronted with new material, so that participants will  
7 not be confronted with new material without notice.

8 Now I have spoken to Mr.  
9 Genest about that earlier and I think he accepts the  
10 general proposition I advanced, and will attempt to  
11 assist us more precisely in the future; but I would  
12 just as a matter of record ask him to confirm that.

13 MR. GENEST: I do, sir. I  
14 think Mr. Scott has a point. The original thought was  
15 that the parties had the assessment and the responses  
16 but I agree they are voluminous and it's difficult to  
17 find them, and I am going to try and provide some  
18 more information on the second panel and it's a little  
19 late for the first panel now. I don't think we're  
20 dealing with very many, and we're dealing with them  
21 only in a rather general way. This becomes more  
22 acute in subsequent panels, and I undertake to provide  
23 a fuller statement of that topic.

24 As I say, we're experimenting  
25 and hope to improve as time goes on.

26 THE COMMISSIONER: I should  
27 say that Miss Hutchinson is the secretary to the  
28 Inquiry, and responsible for the exhibits. She is the  
29 custodian of the exhibits.

30 MR. GENEST: Sir, we're

1 now starting the evidence in chief of Arctic Gas on  
2 the first phase of this Inquiry, and that, sir, will  
3 be covered in four panels, the first of which I will  
4 be calling shortly, the panel which is going to deal  
5 very briefly with the process of route selection,  
6 explain the route and explain in general terms how  
7 it was arrived at, and the processes that were employed.

8 The second panel, a panel  
9 headed by Dr. Clark, will deal with the geotechnical  
10 aspects of the engineering of the pipeline.  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

1 Things such as river crossings, bank stability and so  
2 on.

3 A third panel will deal with  
4 the nuts and bolts, if I may call them that, of the  
5 engineering, the metallurgy of the pipeline, the  
6 metallurgical problems that can be anticipated and how  
7 we propose to deal with them.

8 The fourth panel will deal  
9 with the construction plan of the pipeline covering  
10 such things as schedules, logistics, when we plan  
11 to be in such-and-such a place, and sir, I propose  
12 to call -- to end our evidence in chief on this  
13 phase, Mr. Horthy, assisted by the panel of two or  
14 three witnesses, to deal with the policy matters  
15 that have arisen out of the subject matters dealt

16 with by the previous witnesses. These are experts,  
17 I'm sure it would be helpful to the Commission to hear  
18 from a senior officer of the company as to what it  
19 undertakes to do and proposes to do and to deal with  
20 these related subjects.

21 I have run into some --  
22 within my own grasp, if you call it -- into some  
23 problems as to how to give a complete outline of the  
24 evidence of the policy witness. We are going to provide,  
25 as soon as possible, the parties with those policy  
26 issues that we see presenting themselves out of our  
27 examination in chief, but it is a little hard to  
28 anticipate what is going to arise out of the cross-  
29 examination of the parties. So this may have to come  
30 in pieces. We'll try and do our best to give a statement

1 within that two-week limitation , sir, that your  
2 rulings have imposed. But I ask in advance for some  
3 flexibility as regards that kind of witness.

4 THE COMMISSIONER: Maybe,  
5 counsel can, among themselves, make some progress in  
6 determining the extent to which Mr. Horthy might be  
7 questioned, because we wouldn't want the whole of the  
8 time he is here as a witness to be spent in legal  
9 arguments.

10 MR. GENEST: Then, sir, if I might call  
11 my first panel of witnesses consisting of Mr. P.H.  
12 Dau, Mr. G.L. Williams, Mr. D.W. Watson, and Dr.  
13 J.D. Mollard. I wonder, while they take their places,  
14 sir, the summary of evidence that I have provided  
15 to the parties, contains a statement of the position  
16 and the educational background and qualifications of  
17 these witnesses. I would, rather than read them at  
18 great length into the record, I think Dr. Mollard  
19 would take us the morning, I wonder if I might just  
20 file these as an exhibit and highlight  
21 the witnesses, if that would be satisfactory  
22 to my friends?

23 I have extra copies  
24 available. I think all my friends have a resume which  
25 was provided with the summary of evidence, and if I  
26 might then file with the secretary an exhibit consisting  
27 of the qualifications and educational background of  
28 the witnesses.

29 We were also asked,  
30 sir, to provide the participants and I think in fact

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 your ruling required that we do this, with a list of  
2 the documents which these witnesses have referred to  
3 or relied -- or may refer to or rely upon in connection  
4 with their testimony, and I thought it might be con-  
5 venient if that was filed as an exhibit also. Then  
6 if I then might file with the secretary as the next  
7 exhibit a list of reports relied upon by this panel?

8 MR. SCOTT: Mr. Commissioner,  
9 I have no objection to that mode of proceeding, but  
10 I think it would be helpful not only to counsel but to  
11 others who are in the room if my friend would lead the  
12 witnesses to a brief account of their expertise and  
13 their --

14 MR. GENEST: Oh, I propose to  
15 do that.

16 MR. SCOTT: -- background.

17 MR. GENEST: I propose to do  
18 that. May the panel be sworn, Mr. Commissioner?  
19

20 GUY LESLIE WILLIAMS, sworn:

21 THE SECRETARY: State your  
22 full name, please.

23 A Guy Leslie Williams.

24 JOHN DOUGLAS MOLLARD, sworn:

25 THE SECRETARY: State your  
26 full name, please.

27 A John Douglas Mollard.

28 DAVID WILLIAM WATSON, sworn:

29 THE SECRETARY: State your  
30 full name, please.

Messrs. Dau, Williams, Mollard  
Watson - In Chief

1 A David William Watson.

2 PHILIP HARVEY DAU, sworn:

3 THE SECRETARY: State your  
4 fullname, please.

5 A Philip Harvey Dau.

6 DIRECT EXAMINATION BY MR. GENEST:

7 Q Mr. Dau, you're the  
8 gentleman on the left of the panel, perhaps I could --  
9 we've got some signs here but they're illegible  
10 even to me. This is Mr. Dau, this is Mr. Williams,  
11 next to him is Dr. Mollard, and at the end is Mr.  
12 Watson.

13 Mr. Dau, perhaps I can start  
14 with you. You are Philip Harvey Dau, and you are the  
15 president and chief executive officer of Northern  
16 Engineering Services Company Limited.

17 A Yes.

18 Q Could you tell us what  
19 that is, very briefly?

20 A It's a consulting  
21 engineering group that has been formed to perform  
22 engineering services for Canadian Arctic Gas.

23 Q And what kind of a staff  
24 has it got, roughly?

25 A Roughly a total staff  
26 of about 150, of which 100 approximately are profes-  
27 sional men, draughting and technicians.

28 Q And sir, you graduated  
29 from the University of Alberta in Edmonton in 1948  
30 with a degree of a Bachelor of Science in Civil

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1       En gineering, is that correct?

2                               A       Yes sir.

3                               Q       And you're a member of  
4       the Association of Professional Engineers, Geologists  
5       and Geophysicists       of Alberta, the Engineering Inst-  
6       itute of Canada, and the Canadian Society of Mechanical  
7       Engineers.

8                               A       Yes sir.

9                               Q       And you spent a couple  
10       of years as engineer for a firm of municipal consult-  
11       ing engineers.

12                              A       Yes sir.

13                              Q       And then you were employed  
14       from 1950 to 1954 as the construction superintendent and  
15       chief engineer for Sparling-Davis, and that was a firm  
16       engaged in pipeline construction.

17                              A       Yes sir.

18                              Q       And for the next eight  
19       years you were employed with Dutton, Williams Brothers,

20                              A       Yes sir.

21                              Q       What kind of firm was  
22       that, Mr. Dau?

23                              A       They were both consult-  
24       ing engineers and contractors, and I had some exper-  
25       ience in both fields.

26                              Q       You became manager of  
27       operations of that firm in 1958?

28                              A       Yes sir.

29                              Q       And were you involved  
30       in pipeline projects       during that time?

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

A Yes, very many.

Q Would you outline them,  
please?

A We had numerous clients  
in western and Northern Canada, including Alberta Gas  
Trunkline, Trans-Canada Pipeline, Westcoast Transmis-  
sion, Inland Natural Gas, Pacific Petroleums, Gulf Oil  
Canada, Federated Pipelines, and so forth. These  
involved engineering and construction, up to a certain  
moment in time, in oil and gas pipeline systems.

Q And that takes us till  
1962, when you were appointed, I understand, vice-  
president of engineering of Williams Brothers Canada  
Limited.

A Yes sir.

Q And that was -- what  
was that, a successor to the former firm you were  
with?

A Yes sir.

Q And you, I think in  
your summary, stated that Williams Brothers in 1964  
ceased its construction activities --

A Yes.

Q -- and what did you do  
then?

A Specialized in consult-  
ing, in consulting engineering, construction and  
project management services.

Q To whom, to anybody,  
or were you specialized in one industry or one field?

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 A Primarily in the pipeline  
2 field, although there was some minor amount of work in  
3 other fields.

4 Q And you were appointed  
5 president of this firm in 1971, is that correct?

6 A Yes sir.

7 Q And sir, what was your  
8 area of responsibility with reference to the evidence  
9 with which this panel is going to deal?

10 A Well, as president, I  
11 am responsible for all aspects of the work of Northern  
12 Engineering, and specifically relating to facilities  
13 location, connecting pipeline facilities, construction  
14 plans and alternate corridors.

15 Q And perhaps I can move  
16 to you, Mr. Williams. How old are you, sir?

17 WITNESS WILLIAMS: 52.

18 Q And you're now director  
19 of field services for Northern Engineering Services.

20 A Yes sir.

21 Q And you were formerly  
22 employed by Williams Brothers Canada Limited, which  
23 was Mr. Dau's firm?

24 A Yes sir.

25 Q How long had you been  
26 with them?

27 A Including my time with  
28 Northern Engineering, 18 years.

29 Q And you graduated also  
30 in 1948 with a B.Sc. in civil engineering from the

Messrs. Dau, Williams, Mollard  
Watson - In Chief

1 University of Saskatchewan.

2 A Yes sir.

3 Q And you're a professional  
4 engineer and you belong to the Associations of Pro-  
5 fessional Engineers set out in the exhibit listing your  
6 qualifications. Is that correct.

7 A Yes sir.

8 (QUALIFICATIONS OF PANEL 1 MARKED EXHIBIT 72)

9 (LIST OF DOCUMENTS REFERRED TO BY PANEL 1 MARKED  
10 EXHIBIT 73)

11 MR. GENEST: Q You were with  
12 the Canadian Pacific Railway from 1948 to 1957. What  
13 was your experience there?

14 A This work was mainly  
15 with respect to construction and maintenance of tracks,  
16 buildings, bridges, fuel and water facilities, and I  
17 left the C.P.R. in 1957 as assistant division engineer  
18 in Calgary.

19 Q And from there where  
20 did you go?

21 A To the firm of -- it  
22 was Dutton-Williams then, at that time.

23

24

25

26

27

28

29

30

1  
2 MR. GENEST:

3 Q Is that when you  
4 became associated to Mr. Dau?

5 A That is correct.

6 Q And what kind of  
7 work did you do at Dutton Williams?

8 A Very similar to what Mr.  
9 Dau has outlined. Both in the early years in construc-  
10 tion and more laterly in engineering, consulting and  
11 project management to the petroleum industry and  
12 mainly in Western Canada.

13 Q And in 1963 you became  
14 a project manager with the Williams Brothers?

15 A Yes, sir.

16 Q And what was your ex-  
17 perience then with pipelines following that appoint-  
18 ment?

19 A The largest project that  
20 I worked on as project manager was the 570 miles of  
21 Products Pipeline from Empress, Alberta to Winnipeg,  
22 Manitoba and also in other oil and gas gathering  
23 systems in Alberta and feasibility of slurry pipeline  
24 studies from Saskatchewan and Alberta to Vancouver.

25 Q And you were assigned  
26 to northern engineering services in 1972?

27 A Yes, sir.

28 Q And you have been con-  
29 cerned with this project since that time?

30 A Yes, I have.

Q And your area of

1 responsibility was what, sir?

2 A I supervised the con-  
3 struction of the Sans Sault test facility and have worked  
4 in the area of route location and terrain evaluation and  
5 construction planning.

6 Q Did you have any connection  
7 with this project before the formation of Northern  
8 Engineering?

9 A Yes, sir. Almost from the  
10 inception of our work in 1969 I --for the first year  
11 on a part-time basis and from 1970 on on a full-time  
12 basis.

13 Q So you have been  
14 engaged on this work on this project since 1970 on  
15 a full-time basis?

16 A Yes, sir.

17 Q Mr. Watson, sir, if I  
18 could move to you. You are at the end of the table.

19 MR. WATSON:

20 Right.

21 Q You are a professional  
22 engineer?

23 A That is correct.

24 Q You are with northern  
25 Engineering Services Company Limited?

26 A Yes, I am.

27 Q And you graduated  
28 in 1964 with a degree in mechanical engineering from  
29 the University of Saskatchewan?

30 A Yes.

1 Q And you belong to  
2 the usual professional associations?

3 A Right.

4 Q And from 1964 to 1967  
5 you were with the Steel Company of Canada?

6 A that is correct.

7 Q And what kind of work  
8 were you doing there?

9 A Well, I worked in a  
10 number of departments with the Steel Company of Canada  
11 and these included the industrial engineering depart-  
12 ment, the engineering department itself and purchasing.

13 Q and in 1967 you  
14 joined Williams Brothers?

15 A That is right.

16 Q and what have you been  
17 doing there -- what did you do there?

18 A The first project that  
19 I worked on was the engineering inspection and  
20 supervision of a couple of natural gas dehydration  
21 plants that are located in northern British Columbia.  
22 I was involved in design and engineering and con-  
23 struction/inspection of a crude oil gathering system. I was  
24 also involved in numerous feasibility studies and  
25 cost estimates for crude oil and natural gas pipelines  
26 and gathering systems and I assisted in the planning  
27 and the layout and construction supervision of the  
28 Sans Sault Rapids test facility. This was for the North-  
29 west project study group.

30 Q Which was a predecessor

1 to the Canadian Arctic Gas study?

2 A that is correct.

3 Q And what was your area  
4 of responsibility?

5 A With Northern Engineering

6 Q Yes.

7 A The prime area of respon-  
8 sibility was with the alignment sheets, I co-ordinated  
9 the gathering of the data that went on to the sheets  
10 from the various departments within Northern Engineering  
11 and third party consultants and I ensured that this  
12 was placed on the sheets. I was also involved in de-  
13 tailed route selection that applies on the alignmen t  
14 sheets.

15 Q Now, Dr. Mollard, if  
16 I may turn to you, sir, you are the President  
17 of J.D. Mollard and Associates Limited.

18 WITNESS MOLLARD:

19 A Yes, sir.

20 Q And what is that  
21 firm, Dr. Mollard?

22 A We are a firm that  
23 specializes in the interpretation of aerial photographs  
24 and ground water studies. Those are our two main  
25 areas of specialization and in air photo interpre-  
26 tation our main primary fields are route and site  
27 selection. We have done about 250 of those projects,  
28 examine gravel and various kinds of bore hole searches  
29 -- we have done about 500 of those kind of searches,  
30 so those are the main areas: sites and routes, bore

Dau, Williams  
Mollard, Watson  
In Chief

1643

1 hole and ground water.

2 Q And as to your educational  
3 background, sir, you obtained a B.Sc. in Civil Engin-  
4 eering in 1945, a Master of Science -- that was from  
5 the University of Saskatchewan, the first one and then  
6 you went to Purdue and you got a Master of Science  
7 in the same subject and you obtained a Doctorate in  
8 civil Engineering from Cornell in 1952, is that  
9 correct?

10 A Well, yes, really --  
11 in both my Masters and my Doctors I took about half of  
12 my classes in civil engineering and about half in  
13 geology and related subjects. So it is really -- I  
14 graduated in Civil engineering, but half my course  
15 work was in geology.

16 Q And you belong to the pro-  
17 fessional associations which are quite numerous which  
18 are listed in the exhibit?

19 A Yes, I do.

20 Q And as far as your  
21 professional experience is concerned, sir, you started  
22 in 1945, did you?

23 A That is right.

24 Q As a construction  
25 engineer for the Saskatchewan Department of Highways?

26 A Yes.

27 Q You were employed  
28 for awhile as an air surveys engineer -- that is in-  
29 between your acquisition of degrees. You were an  
30 instructor at Cornell in the School of Engineering, is

1 that correct?

2 A That is right.

3 Q In 1952 I note that it  
4 says that you were research engineer at the School  
5 of Civil Engineering at Cornell. What does that  
6 mean?

7 A Well, we were doing a  
8 study of the -- of beaches and the ability of beach  
9 materials to support various kinds of land and  
10 water equipment moving across the beach and we had  
11 about eight or ten beaches that we studied from  
12 aerial photographs and on the ground. So, that was  
13 about a year long job with research and individual  
14 project there.

15 Q Was this in connection  
16 with the Korean War, Dr. Mollard?

17 A Well, I did work on the  
18 Korean War where we were interpreting aerial photo-  
19 graphs and identifying vegetation and relief and  
20 various aspects of terrain as it affected movement  
21 of vehicles and build up of --

22 I might say that in 1946 --  
23 that was one that you skipped there, that was the  
24 first association with permafrost -- I had actually  
25 at Purdue University in 1945, as a student there, mapping  
26 permafrost in Alaska, which is possibly relevant to  
27 this.

28 Q Right.

29 And then in 1953 you became  
30 a chief of the airphoto analysis and engineering

1 geology division of an initial that I forget what  
2 it stands for -- P.F.R.A. What was that?

3 A That is Prairie Farm  
4 Rehabilitation Administration. They were concerned  
5 with water and so on .

6 Q You had better take  
7 that slowly for the reporters, what was it?

8 A Prairie Farm Rehabilita--

9 Q Prairie Farm -- I  
10 am sorry, I thought it was a scientific term --

11 A Prairie Farm Rehabili-  
12 tation Administration and that is really a branch  
13 of the Canada Department of Agriculture and we were  
14 concerned with irrigation and dam sites in WEstern  
15 Canada, the prairies, really.

16 Q And you were the techni-  
17 cal advisor from 1954 to 55 to the Governments of  
18 Ceylon and West Pakistan on the same kind of work,  
19 is that correct?

20 A Well, actually I was  
21 advisor on setting up a broad resource survey in  
22 WEst Pakistan and then a year or two later in Ceylon  
23 there were several components, one in geology, one  
24 in agriculture and one in forestry.

25 Q And since 1956 you have  
26 been a consultant.

27 A That is right.

28 Q And heading your own  
29 firm. Do you lecture, sir, at any educational insti-  
30 tutions?

1 A Yes, I usually  
2 lecture at least once a year and sometimes twice a  
3 year for about a week and next week I am going down ot  
4 to the University of Alberta and I have 60 people  
5 coming there for a lecture -- so that is a fairly  
6 standard, yearly thing.

7 Q And have you had exper-  
8 ience in connection with the specialty which you  
9 have with pipeline routes and the assessment of  
10 pipelineroutes, the assessment of soils or terrain  
11 conditions to assist in the planning of pipeline routes?

12 A Well -- I am -- going  
13 to fall down a crack here --

14 Q That is a polygon ice  
15 wedge --

16 A That is an ice wedge,  
17 polygon --

18 Yes, I cannot say exactly  
19 how many pipeline projects that I have worked on  
20 from memory, I mentioned that we have done roughly  
21 200 route surveys and many of those have been pipeline  
22 studies over a period of 17 years and some of them  
23 in the north in permafrost areas.

24 Q Do you know of any  
25 firm in Canada that has done more than yours? In  
26 that specialty?

27 A Well, I am not aware of  
28 it --

29 Q And then we have listed  
30 as an appendix -- I am not gong to try -- you have been

Dau, Williams  
Mollard, Watson  
In chief

1647

1 the -- certainly what I would call the prolific writer?  
2 -- you have as appendix B of your qualifications some  
3 9 pages of publications that you -- you have written  
4 extensively in your field, have you, sir, may I  
5 sum it up that way.

6 A Those are my published  
7 papers, I guess.

8 Q Well, may I turn then  
9 to Mr. Dau and ask you if you would, Mr. Dau,  
10 describe to the Commissioner the involvement of the  
11 various members of your panel with this project  
12 and take it in two stages, let us start prior to  
13 the formation of Northern Engineering Services.  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

WITNESS DAU: Williams

Brothers Canada Limited were retained in 1967, by some of the present member companies in the Arctic Gas Study Group, to investigate the feasibility of a natural gas pipeline from the potential producing areas of Northwest Canada to the market areas in the Great Lakes area of Canada and the United States. At that time, the prime potential producing area was considered to be the south-eastern portion of the Yukon Territories and the south-western portion of the Northwest Territories in the Fort Liard area.

Q If I could interrupt you there, Mr. Dau, there was no -- at that time the delta gas potential had not been thought of, or at least explored, or what was its status?

A It was not considered to have enough potential at that time to warrant studies for that additional distance.

Q Would you proceed, please?

A In 1969 discussions were held with producing companies, with potential production in Northwest Canada and Alaska, with the result that the original assignment was expanded to include the potential producing areas of the Mackenzie Delta and Prudhoe Bay in Alaska. By this time, of course, there had been discoveries in Prudhoe Bay.

This assignment resulted in numerous investigations and studies of alternate routes and system configurations, environmental and

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 technical research, construction and operation of  
2 northern test facilities, and investigations into the  
3 technical and economic feasibility of the systems. All  
4 of the members of this panel were involved in that work.

5 Q And then, sir, we discus-  
6 sed it a little bit when I went over your qualifications,  
7 but perhaps you could tell us a little more about the  
8 -- what Northern Engineering Services is, how it was  
9 formed, how it operates?

10 A Yes sir. Northern  
11 Engineering Services Company Limited is a company  
12 incorporated under the laws of the Province of Alberta,  
13 and is registered extra-provincially in the Yukon and  
14 Northwest Territories, and in the Provinces of British  
15 Columbia, Saskatchewan and Manitoba. Northern Engin-  
16 eering Services Company Limited was formed by Williams  
17 Brothers Canada Limited and Pemcan Services. Pemcan  
18 Services is a joint venture consisting of Techman Ltd.,  
19 Shawinigan Engineering Co. Ltd., --

20 Q Techman, T-E-C-H-M-A-N?

21 A Yes sir. Montreal  
22 Engineering Company Limited, and R.M. Hardy & Associa-  
23 tes Ltd.

24 Williams Brothers Canada is  
25 a consulting company specializing in the design,  
26 engineering and construction management of pipeline  
27 systems. Techman Ltd. is the technical arm of the  
28 Loram Group, L-O-R-A-M Group of companies in Calgary.

29 Q What are they?

30 A The Loram Group of

Messrs. Dau, Williams, Mollard, ·  
Watson - In Chief

1 companies include construction, engineering, mining,  
2 and many others.

3 Q And Shawinigan Engineering?

4 A Yes sir, Shawinigan En-  
5 gineering Co. Ltd. and Montreal Engineering Company  
6 Limited are large Canadian companies specializing in  
7 the petrochemical and electrical power fields. R.M.  
8 Hardy & Associates is a consulting geotechnical and  
9 materials engineering group.

10 Q I take it that you drew  
11 on the staff of all of these organizations to form  
12 the staff of Northern Engineering?

13 A That is correct.

14 Q You, for instance, have  
15 been seconded from Williams Brothers along with Mr.  
16 Williams?

17 A Yes, we have seconded  
18 people and of course Northern as a company itself  
19 has their own employees which were hired specifically  
20 by Northern.

21 Q And what was the assign-  
22 ment given to Northern Engineering?

23 A Our assignment is to  
24 provide the engineering, environmental and other  
25 related technical services necessary to determine the  
26 feasibility of an appropriate and efficient method  
27 of constructing a pipeline system to transport natural  
28 gas from Northern Alaska and Northwest Canada to points  
29 as far south as the border between Canada and the  
30 lower 48 states of the United States of America,

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 and to prepare and cause to be prepared applications  
2 for necessary governmental authorities to construct and  
3 operate the pipeline described in the application, to  
4 prepare and furnish for financing purposes, all necessary  
5 and allied information, to furnish plans, recommendat-  
6 ions and reports as may be required, to prepare and  
7 present, through qualified experts, testimony at regula-  
8 tory proceedings and to perform other engineering and  
9 related services as requested by Canadian Arctic Gas  
10 Study Limited.

11 Q That signs like language  
12 taken from a contract.

13 A It was written by a  
14 lawyer, sir.

15 Q What did you really do?

16 A We have performed all  
17 of the engineering and research functions for Arctic  
18 Gas, and all of those -- all of the research and all  
19 of the engineering has not been done by Northern it-  
20 self. In many instances Northern did not have the  
21 particular expertise that was required and we have  
22 retained third party consultants for those specialized  
23 fields , such as metallurgy, for instance. Others  
24 in the geological area, and certainly a lot in the  
25 environmental area, we retained many environmental  
26 consultants.

27 Q But you held the strings,  
28 subject to Arctic Gas's --

29 A Yes sir.

30 Q -- contract with you.

Messrs. Dau, Williams, Mollard  
Watson - In Chief

1 A Yes sir.

2 Q And I think I asked you,  
3 you have a staff of approximately how many?

4 A A total staff at the  
5 present moment of about 150.

6 Q That's a hundred, you  
7 said, were professionals.

8 A Professional staff,  
9 technicians and draughtsmen. There are, I believe,  
10 about -- I think the number is approximately 80  
11 professional staff at the present moment.

12 Q And you work, sir,  
13 exclusively for Arctic Gas?

14 A Yes sir.

15 THE COMMISSIONER: By  
16 "professional", sir you mean professional engineers,  
17 I take it?

18 A Professional engineers,  
19 biologists, and so on. They have a degree in a  
20 particular field.

21 MR. GENEST: Thank you for  
22 clearing that up, sir.

23 I am moving to another  
24 subject, sir. I don't know whether it's your usual  
25 time to take a break or not. I'm in your hands, but  
26 this would be convenient if you're so moved; or I  
27 can go on. I'm in your hands.

28 THE COMMISSIONER: Well, what  
29 do you say, Mr. Scott? I have the feeling we just got  
30 started, but I see it's 10:30, so --

Messrs.Dau,Williams,Mollard,  
Watson - IN Chief

1 MR. SCOTT: It's a matter of  
2 indifference to me, Mr. Chairman.

3 THE COMMISSIONER: Let's  
4 take a break now, Mr. Genest. 10 minutes? 15 minutes?

5 (PROCEEDINGS ADJOURNED FOR 15 MINUTES)

(PROCEEDINGS RESUMED PURSUANT TO ADJOURNMENT)

1 MR. SCOTT: Mr. Commissioner,  
2 can I suggest that as a matter of convenience that  
3 counsel should be permitted to sit when they ask  
4 questions or make rejoinders?

5 THE COMMISSIONER: Yes,  
6 counsel may sit or stand at their convenience, what-  
7 ver suits them and it is entirely acceptable to me  
8 whichever they chose.

9 MR. GENEST: Thank you very  
10 much, sir.

11 Mr. Commissioner, before  
12 I go on to the next subject with this panel which  
13 is a description of the location of the pipeline,  
14 perhaps it might be useful if everyone had with them  
15 volume -- the volume entitled "Location Design and  
16 Capacity of Facilities in Connection Pipeline  
17 Facilities" and we will be referring, sir, in the  
18 course of this evidence to the alignment sheet  
19 which is headed, "Alignment Sheets North of 60".  
20 Which exhibit is that? -- Exhibit 62, and we will  
21 also be referring a little later on to the Fort  
22 Simpson amendment volume which is Exhibit 67 --  
23 No, no, -- that is the book on Fort Simpson -- 66,  
24 Exhibit 66. It might be useful if I indicated  
25 that so that the volumes are handy.

26 Q Mr. Dau, I wonder  
27 sir, if you could -- we have had this before,  
28 but it might be useful to have it again --if you  
29 could describe the location of the prime route and  
30 the ancilliary facilities which Arctic Gas proposes

1 to construct and perhaps we could have the assistance  
2 of one of the members of your panel to indicate it on  
3 the map that is on the wall.

4 WITNESS DAU:

5 A The location of the  
6 facilities proposed by Arctic Gas are described in considera-  
7 ble detail in Section 8 (a) of the application --  
8 I am not sure of the Exhibit number as originally  
9 filed, which includes the two volumes of alignment  
10 sheets, north and south of the 60th parallel. A  
11 revision was made to the original filing in-  
12 corporating the route change near Fort Simpson.  
13 That document has an alignment sheet which is Drawing  
14 No. 4-0234-1004.

15 Q Is that in the short  
16 little volume here?

17 A Yes, sir and it is --

18 Q And under what tab is  
19 it?

20 A Behind the tab, "Lo-  
21 cation of Facilities". It is about the fifth or  
22 sixth page behind that tab and it is the only map.

23 MR. BAYLY: Mr. Commissioner,  
24 if I could interrupt at this point. We have done a  
25 quick canvassing and none of us have received that  
26 volume, although we have received the maps that I believe  
27 go with it from Arctic Gas and I am just wondering if  
28 we are going to receive that.

29 MR. GENEST: Of course, I  
30 am surprised that you have not.

1 MR. SCOTT: The difficulty,  
2 Mr. Commissioner, is that I gather that the revision  
3 was filed with the Minister. The Minister mailed  
4 it out apparently without consulting with his  
5 colleague, the operational head of the post office  
6 and as a result of that failure of communication  
7 it has not arrived in anybody's hands.

8 MR. GENEST: Well, Mr. Carter,  
9 is going to -- I think that we have some copies up-  
10 stairs and I will see that they are distributed this  
11 morning-- I appologize.

12 THE COMMISSIONER: Well, I  
13 take it then that I do not have it either.

14 MR. GENEST: Yes -- that  
15 is Exhibit 66. -- 67., and at least I have one  
16 copy for you.

17 MR. SCOTT: Mr. Genest, so  
18 that we will not all be in the dark, I take it that  
19 you have some other copies upstairs, have you?

20 MR. GENEST: Yes, we have  
21 some other copies upstairs. And why don't I pass this  
22 copy down the table. I will use Mr. Dau's copy.

23 Q Anyway, Mr. Dau,  
24 that is the same as the alignment sheet in the original  
25 volume --

26 MR. DAU:

27 A Yes, sir, except that  
28 it shows the Fort Simpson change. That is correct.

29 MR. GENEST: Well, why  
30 don't we all use -- until we get enough copies -- the

1 original one, and then we will talk about the Fort  
2 Simpson change a little later.

3 If you will all turn to  
4 Exhibit 54 which is Section 8 and 9 -- I am sorry, I  
5 am bogging you all down, Mr. Commissioner. There  
6 is map, a long pull out map under the tab "System  
7 map" and that shows the same information, except that  
8 it shows the route before we made the Fort Simpson  
9 amendment. So perhaps that will resolve the problem  
10 while Mr. Carter is digging up the copies.

11 Let's start again.

12 MR. DAU:

13 A I will ask Mr. Williams  
14 to mark off the description on the map on the  
15 wall as I go through the location.

16 The Richards Island supply  
17 line originates at a location on the northside of  
18 Richards Island in the Mackenzie Delta. The direction  
19 follows a route in a southeasterly direction to a  
20 location called Travaillant Lake Junction near Tra-  
21 vaillant Lake. A lateral line some 15 miles in  
22 length connects the producing area near Parsons Lake  
23 to the Richards Island supply line.

24 The supply line from Prud-  
25 hoe Bay enters Canada on the Alaska/Yukon Border  
26 some 5 miles south of the Beaufort Sea coast and follows  
27 a route in a southeasterly direction parallel to the  
28 coast and the Mackenzie Delta to an area near Fort  
29 McPherson and then proceeds easterly to the Travaillant  
30 Lake Junction. From this junction the route lies east

Dau, Williams .  
Mollard, Watson  
In Chief

1 and generally parallel to the Mackenzie River to Fort  
2 Simpson. And in this case of course there is  
3 the revision at Fort Simpson. From Fort Simpson the  
4 system follows a route directly to Zama Lake in  
5 Alberta and then generally parallels the facilities  
6 of Alberta Gas Trunk Line, passing west of the  
7 town of Peace River and east of Edson to a location near  
8 Rocky Mountain House called Caroline Junction.

9 MR. GENEST: Excuse me, Mr.

10 Dau, can we see that, if we turn to the map -- in  
11 volume, in exhibit 54, that is volume -- or that is  
12 Section 8, there is a map of North America there.  
13 Can we see that sort of illustrated on that map?

14 A It is illustrated on  
15 that map, but it is also shown on this pullout map.

16 Q That shows south of  
17 60 does it not?

18 A Yes.

19 Q Of course, sorry.

20 Proceed.

21 A From Caroline Junction  
22 one delivery lateral generally parallels the facilities  
23 of Alberta Gas Trunk Line and Alberta Natural Gas  
24 Company to Kingsgate on the B.C./Idaho Border.  
25 Another delivery lateral originates at Caroline  
26 Junction, again paralleling the facilities of Alberta  
27 Gas Trunkline to Empress on the Alberta/Saskatchewan  
28 BOrder and then proceeds directly to a point near  
29 Monchy, Saskatchewan, on the Saskatchewan/Montana  
30 Border.

1 Q I notice that the  
2 reporters have not got that -- that is --

3 A Monchy. M.O.N.C.H.Y.

4 Q Right.

5 A The map also, and I  
6 am referring to this map, shows the location of  
7 49 compressor station sites, and indicates the  
8 operating year in which the stations will be required,  
9 as well as indicating the future stations that may be  
10 required under the gas throughput levels used for  
11 filing. The locations --

12 MR. GENEST: Can I just in-  
13 terrupt you there, Mr. Dau. I am just trying to  
14 find out the key to the legend and you have compressor  
15 stations -- for instance, I am looking near Fort Norman,  
16 M-09 (400) then 2 -- What does that tell us?

17 A M-09 is the number of  
18 the station.

19 Q Right.

20 A The 400 in the brackets  
21 is the mile post of the station. The 2 is the year  
22 in which it is required -- that is operating year --

23 Q Measured from what start  
24 point?

25 A Operating year one.

26 Q Operating year one.  
27 That is after you have built it, tested it and you  
28 have started to put gas through it?

29 A Yes, sir, and the  
30 black dots indicate that that particular station has

1 the chemical refrigeration to chill the gas and  
2 on this you go farther down the system and there  
3 are circles and also some locations which are the  
4 circles with half filled with black. The  
5 legend on the right hand side of the sheet describes  
6 what they are --

7 MR. GENEST: Mr. Anthony --  
8 was there any trouble, Mr. Anthony?

9 MR. ANTHONY: No, I was  
10 just trying to get -- apparently there is confusion  
11 about the exhibit numbers. I just wanted to make  
12 sure that we have the right, proper exhibit numbers.

13 MR. GENEST:

14 Q Then you have  
15 some here showing the letters F.U.T. -- Foot --

16 MR. DAU:

17 A Those are future stations.  
18 They apply to the supply laterals and those are  
19 stations that would be required beyond the gas  
20 throughput levels in the filing.

21 Q Sorry, could you explain  
22 that a little more.

23 A Yes, if we go to the  
24 Prudhoe Bay lateral, the first station inside  
25 Canada is C.A. -05 at milepost 224. It is required  
26 in operating year 2 and it has mechanical refrigeration.  
27 It also happens to have a measuring  
28 station required in the year 2.

29 We go to the next station  
30 to C.A.-06, milepost 270. It is required in

Dau, Williams  
Mollard, Watson  
In Chief

1661

1 the future when the volume flowing through that  
2 lateral is in excess of 2 1/4 billion feet a day.

Messrs. Day, Williams, Mollard,  
Watson - IN Chief

1 A Continuing on, the loca-  
2 tions of measuring stations are also shown, one  
3 near the Alaska-Yukon border, one at Richards Island,  
4 one at Parsons Lake. Those are the locations where  
5 natural gas enters the system, one near station M-27  
6 on the Alberta-B.C. border, and at the Alberta-  
7 Saskatchewan border for delivery to other pipeline  
8 facilities.

9 Q What is the purpose of  
10 measuring stations?

11 A To measure the quantity  
12 of gas that either enters or leaves the system.

13 Q What do you need them  
14 for?

15 A It's a control of gas  
16 in the system. Q: It permits you to send a bill out.

17 A: Yes, there are also measuring stations at Kingsgate and  
18 Monchy where gas leaves the system.

19 Operating and maintenance of  
20 division headquarters are shown located at Inuvik  
21 and at Calgary, and district headquarters are shown  
22 located at Norman Wells, Fort Simpson and Peace River.

23 This particular map also shows  
24 the location of 45 stockpile sites.

25 Q Where do those - -  
26 they are black triangles, are they?

27 A Yes sir.

28 Q And the white triangles  
29 are stockpile sites of wharves?

30 A Yes.

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 Q These are stockpiles for  
2 what?

3 A Stockpiling pipe, preparation  
4 material and so on, required during construction.

5 Q Now that is the prime  
6 route we have described.

7 A Yes sir,

8 Q And you have also filed  
9 some details in connection with what we call the  
10 interior route, which I note is not shown on the map  
11 on the wall.

12 A I'm sure  
13 Mr. Williams can follow it through.

14 MR. GENEST: Q Would you  
15 describe -- perhaps, sir, we could arrange to mark  
16 that one, too, if none of my friends object. I could  
17 have one of my people take a black line and get a  
18 ladder and sometime mark the interior route as I'm  
19 sure we'll be discussing it at some length.

20 Would you describe that, Mr.  
21 Dau?

22 A Yes, the interior route  
23 was selected to pass south of the Arctic National Wild-  
24 life Range in Alaska. In this case the Prudhoe Bay  
25 supply lateral enters Canada on the Alaska/Yukon  
26 border some 20 miles northwest of the Village of Old  
27 Crow. The route proceeds easterly, passing south of  
28 the lake area known as Old Crow Flats, and north of  
29 the Porcupine River. The route crosses the Richard-  
30 son Mountains near the headwaters of the Rat River in  
the Yukon, and the Barrier River in the Northwest

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 Territories. It continues eastward down Stony Creek  
2 Valley and joins the prime coastal route near the Peel  
3 River crossing about five miles north of Fort McPherson.

4 Q And then it follows it  
5 along to the junction point?

6 A Yes, that's right. It's  
7 right on the lake. This particular route involves  
8 very difficult construction in the Brooks Mountains in  
9 Alaska and the Richardson Mountains in Canada, and will  
10 cost several hundred millions dollars more than the  
11 prime coastal route.

12 Q And I take it you had  
13 reference to the Arctic National Wildlife Range in  
14 Alaska, and that is along that part of the coastal  
15 route which is within the borders of Alaska.

16 A Yes.

17 Q And that has caused some  
18 environmental concern.

19 A Yes sir.

20 Q The route, the interior  
21 route you described, I understand, is designed to  
22 avoid that range.

23 A That's correct.

24 Q Then, sir, may I ask  
25 you to describe the process of route selection?

26 THE COMMISSIONER: Excuse me,  
27 Mr. Genest,  
28 before you do that, will we be told at any stage how  
29 much greater the cost that the interior route would  
30 likely be than the cost of the prime route?

MR. GENEST: I think Mr. Dau

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 can give you that.

2 Q Do we have that detailed  
3 cost information?

4 A I don't have the details  
5 here, sir, but it's in excess of \$500 million, if I  
6 remember correctly, some \$550 million.

7 THE COMMISSIONER: That's the  
8 difference?

9 A That's the difference.

10 MR. GENEST: But I could  
11 certainly provide you with more detailed information,  
12 sir, if that becomes a matter of --

13 THE COMMISSIONER: Well, rounded  
14 off, it's half a billion, that sounds like it will do  
15 for now.

16 A I believe those compari-  
17 MR. GENEST: sons are -- when we deal with the alternative corri-  
18 dors I believe we can deal with -- in more detail  
19 with that, sir.

20 THE COMMISSIONER: I simply  
21 wanted to have that in mind.

22 MR. GENEST: Q Then, Mr.  
23 Dau, I'm going to ask you to describe the process of  
24 the way you go about selecting this route.

25 A The factors considered  
26 in the selection of the route are set forth in  
27 Section 8(a)(i) as revised, 8)a(i) to (viii).

28 Q That's the first tab?

29 A Yes sir.

30 Q There's a red tab called

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 "8(a), Facilities Location,"  
2 and there's a pink tab called,  
3 (i) Description."

4 A Yes.

5 Q And that's where that's  
6 discussed.

7 A Right. In general, the  
8 proposed route was determined after detailed study of  
9 maps and photomosaics, aerial and ground reconnaissance,  
10 and terrain and soil study. The final route selection  
11 shown on the alignment sheets involved consideration of  
12 the technical and economic feasibility of the various  
13 alternatives, together with environmental and socio-  
14 logical considerations.

15 The criteria which was  
16 established for route location, was as follows:  
17 With all factors being equal, the most economical  
18 pipeline route is the shortest distance between the  
19 source of supply and the point of delivery. From this  
20 base, adjustments were made to take into account the  
21 following:

- 22 .(1) The proximity of the pipeline to other known and  
23 probable future sources of supply;  
24 (2) Terrain barriers, including mountain ranges,  
25 lakes and rivers;  
26 (3) Other topographic features, surface vegetation  
27 and land use;  
28 (4) Soil characteristics and slope stability;  
29 (5) Access for construction and future maintenance  
30 and operation;

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

(6) Consideration for wildlife including mammals,  
fish and birds;

(7) Proximity of large urban centres; and in this  
particular route there is no concern, of course,  
with large centres;

(8) In permafrost terrain (which is the main factor  
that makes this project different from other  
major pipeline projects) the avoidance of:

- . Side hillocations in high ice content fine-grained soils;
- . Degradation of thermokarst areas;
- . Unstable banks at river and stream crossings;
- . And avoidance of areas of potential pipeline buoyancy.

Q Now pipeline buoyancy  
is when you have ground that makes it float, float up  
to the surface?

A Yes sir, the pipeline  
is buoyant in water, for instance, and it would float.  
It's necessary to put on weights to keep it submerged.

Q You want to try and  
avoid those areas if you can.

A Yes, where it's feasible  
to do so. In many areas it's not feasible to avoid it.

Q Well then, let's go  
through this step by step, Mr. Dau. How do you go  
about selecting a route?

A The initial map studies  
commenced in early 1969 when the sponsors of the  
project at that time decided to expand the study of

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 line from Fort Liard area of the Northwest Territories  
2 to consider deliveries from the Mackenzie Delta and  
3 Prudhoe Bay potential gas supply areas.

4 Alternative routes were con-  
5 sidered from ~~these~~ points to the Trans-Canada Pipeline  
6 system near Brandon, Manitoba, and the Canadian-U.S.  
7 border crossing location near Emerson.

8 Q When you talk of map  
9 studies, what do you do, do you just take out  
10 detailed maps of the general area and look over the  
11 terrain?

12 A We get the best available  
13 maps and based on the information on the maps, attempt  
14 to locate the shortest route between the two points  
15 under consideration, considering the barriers that  
16 are obvious on the maps. In many cases these maps were--  
17 in some instances these maps were at a scale of  
18 8 miles to an inch at that time.

19 Q Then what do you do?

20 A Once the map study was  
21 complete, the major alternative routes were flown by  
22 engineers experienced in pipeline location, using both  
23 helicopters and fixed wing aircraft. These reconnaissances  
24 ~~trips~~ deleted some of the alternatives and others were re-  
25 tained for further study.

26 Q Will you stop there?

27 You first look at a map and you see from the map that  
28 there is a great mountain range here and you don't  
29 want to go there, so you pick out a general route that  
30 way. Do I understand that correctly?

Messrs. Dau, Williams, Mollard,  
Watson - InChief

1                   A     Yes, that map, for  
2 instance, may have 500 foot contra-intervals.

3                   Q     Yes.

4                   A     And on a 500-foot contra-  
5 interval in a map study you may conclude that it's a  
6 feasible route, but once you go look at the terrain  
7 you will find that the terrain is very undulating, very  
8 difficult, and that particular section would probably  
9 be deleted.

10                  Q     So your next step then  
11 is to look over, on the ground or from the air, fly  
12 over the route you've selected just from the map.

13                  A     Yes, with at that time  
14 considering construction difficulties access and so  
15 forth.

16                  Q     Where does that get you?

17                  A     That narrows down your  
18 alternatives so that you're then in a position to  
19 look at more definitive areas in much greater detail.  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30

Dau, Williams,  
Mollard, Watson  
In Chief

1670

1 Q And is that the next  
2 step?

3 A That is the next step,  
4 sir.

5 Q And could you describe  
6 the next step, what you do then.

7 A We obtain two copies of  
8 the existing Canadian and U.S. Government aerial  
9 photography to cover the area under consideration.  
10 Dr. Mollard also obtained small scale photo mosaics  
11 at a scale of about 10 miles to 1 inch over the  
12 coastal and Interior Route areas and over the  
13 Mackenzie Valley.

14 Q Let me stop you  
15 there again, Mr. Dau, excuse me. You have -- the  
16 first two steps, the general map study and the  
17 flying over, does that narrow you down to a certain  
18 area of ground? Or sort of corridor or a general  
19 route?

20 A It would narrow you  
21 down to probably alternative corridors and -- carefully--  
22 corridors may be very wide in that sense.

23 Q Well, how wide?

24 A They could be 40 or  
25 50 miles wide in that sense, before you literally go out  
26 fly it but once you have flown the route, they  
27 are much narrower of course.

28 Q Well, after you have flown  
29 the route, to what area have you boiled it down,  
30 generally?

1                                   A     In a general sense  
2     probably within 10 or 15 miles.

3                                   Q     And so you have got a  
4     corridor if we can call it that of about 10 or 15  
5     miles wide, maybe wider in some areas, smaller  
6     in others.

7                                   A     Yes

8                                   Q     But that is the general  
9     parameter, if I can use that scientific word.

10                                  A     Yes, sir.    I might  
11     add that these small scale photo mosaics that Dr.  
12     Mollard obtained at this scale of 10 miles to the  
13     inch are -- cover an area which is really an overview  
14     of 100 to 150 miles in width.  In other words it  
15     covers the whole valley, the whole coastal plain.  
16     We then had several meetings with Dr. Mollard to  
17     obtain the benefit of his knowledge, with particular  
18     respect to permafrost and potential terrain problems  
19     to be encountered over the northern portion of the  
20     route.

21                                  Q     Excuse me again,  
22     Dr. Mollard got into the act, if I can call it that,  
23     after you had narrowed the route down to this  
24     general corridor 10 to 15 miles wide?

25                                  A     Yes, sir, it was after --

26                                  Q     After that --

27                                  A     After the aircraft --

28                                  Q     Right--

29                                  A     Reconnaissance flight.

30     In preparation for his analysis Dr. Mollard participated

1 in some of the early reconnaissance trips, you must  
2 understand that there were many of these reconnaissance  
3 trips to go back and investigate some of the alter-  
4 natives that were available to us.

5 He then used one set of  
6 photography to identify terrain types in a band  
7 varying from a four to nine miles wide. The width  
8 of this band of terrain typing is dependent on  
9 the scale of the photography that is available.

10 Q So what did you want then  
11 from Dr. Mollard? You wanted to know more about  
12 the kind of terrain that was in that band?

13 A Yes, sir, we wanted to  
14 be able to anticipate what type of terrain so we  
15 could assess it with respect to construction diffi-  
16 culties and operating difficulties and so on.

17 Q Well, then, Mr. Dau,  
18 I am going to ask you to illustrate all of this  
19 by reference to a specific section of the line and  
20 I understand that the one we picked is the one that  
21 appears in -- what is the exhibit number --  
22 Exhibit 62, which is the Alignment Sheets North  
23 of 60, and the sheet that I ask you to use is the  
24 sheet that is called 1 C 10200 - 1015, and that  
25 appears -- 1 C 10200 - 1015 and that is at the  
26 back of the book and before you do that, before you --  
27 well, you go ahead your own way -- I am like Mr. Scott.  
28 I do want to have a little evidence though to  
29 help people to understand what it is these alignment  
30 sheets show. I notice that they are in duplicate.

1 One has green information on it and the other has  
2 black information on and I wanted you to explain the  
3 use to which both of these are put -- would you  
4 go ahead.

5 A The green information  
6 relates to environmental factors, the black is more  
7 on technical. This is a viewgraph of that particular  
8 alignment sheet. The numbers in the lower right hand  
9 corner 1 C - 0200-1015. The map inset in the  
10 corner identifies the location on a larger scale  
11 map of the area, and it is the little black triangle  
12 identifies this particular location of this particular  
13 alignment sheet which is on the west side of the  
14 Mackenzie Delta, west and a little south of  
15 Aklavik.

16 Q Right.

17 A The legends. This corner  
18 of the sheet lists --

19 Q That is the left hand  
20 corner, the bottom left hand corner?

21 A Right, sir,

22 Q Right.

23 A Has a legend of all the  
24 symbols that are used. This lists engineering  
25 data relating to the pipeline route which is shown  
26 in black on this alignment sheet.

27 Q Now, you are showing so  
28 that we have a record that makes some sense, Mr. Dau,  
29 when you say this, you are showing the material  
30 immediately above the pipeline legend on the bottom

A The is the limit of the Delta, the M.R.D. terrain type. This is the channel in the Delta, Husky Channel. This is the Willow River. There are, at the top of this sheet, there are data relating to test holes that have been drilled in this area. The top of each one of these test holes

1 has a number, B 2520, for instance, and you can find  
2 that number on the aerial mosaic. That is the location  
3 of the test hole, this is the information that was  
4 obtained when that test hole was drilled.

5 Q Right.

6 Then there is a profile in-  
7 between that data and the alignment sheet itself,  
8 what is that?

9 A This is the profile of  
10 the pipeline route and in this particular instance  
11 I believe that it varies from about 25 feet to 175  
12 feet. The scale is on the left hand side of the  
13 sheet.

14 Q That is above sea level?

15 A Yes, sir.

16 THE COMMISSIONER: Dr. Dau,  
17 you might have said this, but I was scanning  
18 through the documents and must have missed it. I  
19 take it that we are to turn that map by 90 degrees,  
20 I take it the pipeline is going north/south, in that  
21 map, is it?

22 A Yes, generally --  
23 that is the north direction, sir.

24 MR. GENEST: North is at the  
25 left hand side.

26 THE COMMISSIONER: Yes, I thought  
27 it must be but you never know.

28 A These are long  
29 strips and we try to set the pipeline in the strip.

30 MR. GENEST: I might say,

1 Mr. Commissioner, that Mr. Dau is one of the few  
2 people around here, including Mr. Scott and I who is  
3 not a doctor, one of the last we will see.

4 Q I interrupted you really  
5 to ask about these alignment sheets. I then would like  
6 to ask you or perhaps Dr. Mollard to illustrate the  
7 work that he contributed, how he went about his work  
8 to assist you in the pipeline selection. Are  
9 you going to deal with that or is Dr. Mollard?

10 A I think that Dr. Mollard  
11 should deal with that.

12 Q Dr. Mollard, could you  
13 take over.

14 DR. MOLLARD:

15 A I shall carry on, shall  
16 I?

17 Mr. Commissioner, I have  
18 made some notes here on one piece of paper to  
19 just describe the procedure that I went through and I  
20 will just be referring to it briefly as I speak more  
21 or less extemporaneously.  
22  
23  
24  
25  
26  
27  
28  
29  
30

Messrs. Dau, Williams, Mollard,  
Watkins - In Chief

1 My job, as has been pointed  
2 out, was to present terrain data in a way that would  
3 be helpful and useful to my client's personnel, includ-  
4 ing route location people, persons concerned with  
5 geotechnical studies and vegetation, and other studies,  
6 and the object was to try and identify the terrain and  
7 classify the terrain and map it so that it would be  
8 useful to these people that were doing the route  
9 location and appraisal of the information.

10 So really there are several  
11 components here. First of all you have to recognize  
12 what the terrain looks like, just like a photograph  
13 of a person which has features that identify them. Then  
14 once you think you can recognize it satisfactorily,  
15 then you have to classify it, because you have large  
16 areas which you're dealing with, that are classified  
17 according to a system that makes sense in terms of  
18 the use of the data; and then for my part, after I  
19 **felt** I could classify it I had to map it because  
20 several different people were going to use the map  
21 data.

22 Now you may ask, first of all  
23 what is terrain? How do I think of terrain? Well, I  
24 think of it more or less as landscape with a third  
25 dimension down into the ground. That is, when you  
26 look out of the window you see terrain, you see  
27 vegetation, you see rocks, soil, man's activities,  
28 lakes, swamps, and so on, so that it's appropriate,  
29 I think, that we think in terms of areas. It's a  
30 piece of ground for a particular use, and we say

Messrs. Dau, Williams, Mollard,  
Watkins - In Chief

1 it's wet ground, or you might say it's rocky ground,  
2 or gravelly ground, or terrain, which is more or less  
3 synonymous in that case with ground.

4 So that's briefly how I would  
5 visualize terrain. Several components, drainage,  
6 erosion, relief, what we call land forms, land forms  
7 are units, relief forms on the surface like a sand  
8 dune, for example, which is composed of sand about the  
9 size of sugar; or and I have an illustration, an  
10 esker which is a winding -- it looks like a railway  
11 gradient, sinuous and winding and composed of sand and  
12 gravel --

13 Q How do you spell that,  
14 doctor?

15 A E-S-K-E-R, and it's  
16 composed of sand and gravel, and as I say I'll show  
17 you an illustration, which is deposited in a river  
18 bed in the tunnel in dead ice or stagnant ice, because  
19 if the ice moved it would just spread the sand and  
20 gravel bed, which is about the width of a river, or  
21 a railway, across the landscape. So these are compon-  
22 ents of terrain that we look at and we look at them  
23 separately under terrain analysis and the inter-  
24 facing or relation of one to another, so we come to  
25 the term "terrain analysis". What do we mean by  
26 "terrain analysis"? Well, I look at aerial photo-  
27 graphs and try and figure out how the land is made,  
28 the composition of the land, the anatomy, you might  
29 say, of the land, and the component parts, and in  
30 that, my analysis, using aerial photographs and looking

Messrs. Dau, Williams, Mollard,  
Watkins - IN Chief

1 down vertically from various heights, just as the  
2 camera in the plane looks down, some cases two miles,  
3 some cases seven miles, above the ground surface, and  
4 I look at these photographs in 3-D, simply with a little  
5 pocket stereoscope and this is the one that I use  
6 which costs \$20, and the older I get the poorer my eyes  
7 get and the more I have to bend the legs on it to see  
8 in 3-D, but this is what I use.

9 My professional work, of course,  
10 is in terrain analysis, and is not too terribly differ-  
11 ent from an amateur -- what you might call an amateur  
12 terrain analyst, for example, driving in from the air-  
13 port here, you see a ski slope there. Well, a person  
14 standing at the top of that ski slope is doing  
15 terrain analysis in a way when he stands there and he  
16 looks down the slope and he says, "How steep is it?  
17 How narrow is the path that I have to go down there?  
18 Is that good going or poor going?"

19 If it were somebody like  
20 myself, I'd say, "How soft is the terrain at the  
21 bottom of the slope?" But that is sort of an amateur  
22 terrain analysis, and we do that when we stand on a  
23 mountain peak or a hillside looking down a slope.  
24 We're looking at the various units of terrain and  
25 we're saying, "How do they relate to one another, and  
26 what do they mean to me?"

27 Now in doing this work, I  
28 prefer to look at high level photographs, that's  
29 pictures taken from oh, 30 or 35,000 feet, six to  
30 seven miles, because I get a big picture of the land-

Messrs.Dau,Williams,Mollard,  
Watkins - In Chief

1       scape, and if I'm going to try and identify what's  
2       at a point, in other words if I put a -- take a pencil  
3       and put it down on the photograph and I say, "What's  
4       under that pencil? I want you to tell me."

5                               This is what I do in class  
6       with students.                "What is underneath that  
7       point?" If you want to get to that point, the easiest  
8       way is to look at that terrain from a high level first  
9       and then come down successively to lower levels be-  
10      cause if you took me, for example, sitting here --  
11      and I don't want to take anybody there -- and say,  
12      a square inch on the side of my face might mean very  
13      little, you couldn't identify me, it's too small an  
14      area; but if you stand back and look at a whole pic-  
15      ture of me (and that's what we're doing with aerial  
16      photographs, we're dealing with pictures) and my  
17      orientation is identifying features in pictures  
18      somewhat as you would do a picture of your grandmother  
19      but through the years I get to recognize the distin -  
20      guishing features. So that's roughly how we go about  
21      it -- try to look at a high level photograph first  
22      and get a broad perspective of the terrain, and if  
23      I want to understand the Mackenzie Valley and the  
24      materials in the Mackenzie Valley, possibly the  
25      problems in the Mackenzie Valley, then I have to first  
26      of all get a framework of reference, so that I under-  
27      stand the geology and the processes that have gone  
28      on in the valley when they occurred because the landscape  
29      has a history just like a person, and it's Mother  
30      Earth, and if we are going to try to treat her gently

Messrs. Dau, Williams, Mollard,  
Watkins: - In Chief

1 we've got to understand her, and that's part of this  
2 first process of looking at the high photograph, look-  
3 ing at the broad picture, and one of the first things  
4 as Mr. Dau mentioned when I got into -- Mr. Genest, when  
5 I got into the act -- was to try and take the whole  
6 Mackenzie Valley corridor and figure out the geology,  
7 where different kinds of terrain were, how they were  
8 formed, what the composition, how deep the muskeg was,  
9 where there was an old lake bed, where the sediments  
10 had come down vertically, maybe silt and clay in very  
11 fine particles and settled in 600 feet of water, that's  
12 a different kind of terrain from the terrain where the  
13 ice has gone along like a bulldozer and pushed material  
14 underneath the ice, and as Dr. Fyles said in his  
15 overview, it produces glacial till. It's shoved in  
16 under the ice, so we may have a mile or two or three  
17 of ice. That's a different material, has different  
18 properties than silt and clay that have<sup>filtered</sup> down through  
19 3 or 400 feet of water, and then as the ice recedes,  
20 out of the valley it might block the valley tempor-  
21 arily so that as it's melting and there's a piece of  
22 ice sticking in, as there was say west of Fort  
23 Simpson, and another one at Great Bear depression,  
24 these blocks of ice are sitting in there and they're  
25 dams and they create a temporary lake, and one of  
26 my first studies in the framework in High Level  
27 photographs study and mosaic study was to find out  
28 where these lakes were, what the top level was, and  
29 where the major glacial rivers, that's rivers from  
30 the melting of the glaciers, came into the lake.

Messrs. Dau, Williams, Mollard,  
Watkins - In Chief

1 For example, the Liard carried a lot of sand and silt,  
2 the Nahanni and Ruth farther up. The Great Bear and  
3 the Mountain River, these are points where you have a  
4 different material because the river carrying sand  
5 and silt comes into that old lake. So this broad frame-  
6 work was one of the first things that I tried to estab-  
7 lish so that I would have a confidence level in my  
8 subsequent looking at lower level photographs.

9 So in effect, in short what  
10 you're trying to do is try to understand the forest  
11 before you look at the individual trees, I guess.  
12 That's one way of saying it.

13 Well, I think if I'm right,  
14 Mr. Dau, I started assisting and working on the project  
15 in 1969, and at that time we always try to get  
16 every bit of information, particularly government  
17 information and G.S.C. information which I think is  
18 wonderful, as far as I'm concerned, because I find it  
19 a great help; but we got the glacial map of Canada  
20 and that showed us where the ice moved. We were going  
21 to see it in High Level photographs right here and  
22 subsequently in the last couple of years we were  
23 going to see it in satellite imagery; but at that time  
24 we didn't have the satellite imagery, we had the  
25 mosaic. So we got the glacial map of Canada which show-  
26 ed us, in rather broad outline, the general advance of  
27 ice into the Mackenzie Valley, where it moved in, and  
28 perhaps where it sat and melted back, and there might  
29 be three or 400 feet of water against the ice into which  
30 these very fine sediments were deposited.

Messrs. Dau, Williams, Mollard,  
Watkins - IN Chief

1                                   Then we got a map that showed  
2       the retreat of ice out of the valley, because we were  
3 interested in the history. We wanted to know, well,  
4       the ice occupied the Mackenzie Valley about 15,000  
5 years ago, let's say, and then started retreat to the  
6 east, eastward, and it didn't do that uniformly, it  
7 melted faster in some places and slower in others, and  
8 we wanted to know this because we had to get down to  
9 specifics as soon as possible. Yes?

10                               THE COMMISSIONER: Excuse me,  
11       you mean  
12       it was melting on the east side and it was not melting  
13       on the west, is that right?

14                               A       Well, there would probably  
15 be valley glaciers in the Mackenzie Mountains to the  
16 west, but I'm referring, Mr. Commissioner, to the  
17 huge continental ice sheet which started west of  
18 Hudson's Bay and spread out in a big row and migrated  
19 across us here at Yellowknife, and west to the  
20 Mackenzie Valley, so that the migration or flow of the  
21 ice, when it got thick enough it flowed westward into  
22 the Mackenzie Valley and down around these mountains  
23 and up the Mackenzie Valley. Then when it started to  
24 melt, it sort of melted backwards in the same direction  
25 to the ~~the~~ east that it had originally flowed, and so  
26 that it melted in an eastward -- general eastward  
27 direction and I don't know, maybe here at Yellowknife  
28 where we're sitting, the ice front was over us here  
29 about 10,000 years ago.

30                               So those two maps we used,  
and then because we wanted to be more specific, we

Messrs. Dau, Williams, Mollard,  
Watkins - In Chief

1 ordered the topographic map Mr. Dau has mentioned, be-  
2 cause we felt we could see level benches along the side  
3 of the valley and we thought, "Well now, if the top of  
4 that level bench comes up to 900 feet, and we can see  
5 where the ice could block off and give you a lake,"  
6 it doesn't exist there now, of course, it's drained,  
7 but where it could have given us a lake, this gave us  
8 further evidence and confidence. So we wanted to figure  
9 out this glacial retreat history and the system of  
10 lakes in the valley, because then when we came down we  
11 had another tool to correlate with the direct looking  
12 at a photograph. In other words, we had some blood  
13 sample data in addition to the photograph of a person  
14 that we were looking at.

15 We also got the government  
16 vegetation maps, the best that were available at  
17 that time, on a quite small scale, and of course we  
18 rifled the National Atlas of Canada, every map that  
19 they had in there that pertained to the Mackenzie  
20 Valley, and as Mr. Dau has mentioned earlier, we  
21 ordered the one inch equals 10 mile mosaics, and  
22 at that time we also ordered the High Level photographs  
23 of a good substantial part of the valley which would  
24 be about one inch equals a mile, and that's a good  
25 starting place because if you come down too low and  
26 start interpreting, down to a wart on the side of  
27 your face, you're looking into the trees, but when  
28 you get up high you can see the geology and the trees  
29 are dwarfed so that in effect they look like grass.  
30 You see the relief, you don't see the vegetation, and

Messrs. Dau, Williams, Mollard,  
Watkins - IN Chief

1 at that level we wanted to mask out the effect of the  
2 vegetation, we didn't want it to harm us in figuring  
3 out the geology.

4 Now I think I've covered  
5 in a rather general way most of the things that I wan-  
6 ted to leave with you and I think that I'll probably  
7 go to some slides and maybe I can drawn some examples  
8 in them that are familiar to you. There was one this  
9 morning when we were having coffee here, I looked out  
10 the window and I could see a nice polish, nice smooth  
11 whale-back polish on the rocks right across the  
12 window. You want to look at them when you go out at  
13 lunch. They're the same features that I have shown  
14 on one slide, except that instead of bedrock materials  
15 that we see out the window here, mine are soil  
16 materials, boulders and silt, sand and gravel, all  
17 mixed up, churned around and moved underneath the  
18 ice but they look in shape very much like the bedrock,  
19 scraped and abraided rock in front of the building  
20 here.

21 Now I've selected about  
22 18 slides out of about 250 that I have on permafrost,  
23 including air photos and satellite imagery and ground  
24 photographs showing permafrost features and closeup  
25 of samples, and so if you'll bear with me, I'll put  
26 them on the screen and go through them and try and  
27 explain them as best I can what I see on them and that  
28 I think might be most helpful to you, Mr. Commissioner.

Messrs. Dau, Williams Mollard, and  
Watson  
In Chief

1 Q We've taken a leaf from Mr.

2 Scott's book in the overview and I will arrange to  
3 have these slides reproduced and put in a book so that  
4 they can be on permanent exhibit at these hearings.

5 THE COMMISSIONER: Thank you.

6 DR. MOLLARD: I might say that I  
7 can feel a little bit for the people in the back of the  
8 room, because to me this looks very sharp and clear, but  
9 it's just like I was telling you, that, in recognizing  
10 people you see them from a block away, they look very  
11 small and you can just barely, barely recognize them, and  
12 then when you get up and look at them from two or three  
13 feet away you can see the detail. So I have the advantage  
14 here of seeing a great deal of detail, a foot or two, that  
15 you may not be able to see, it may be sort of fuzzy in  
16 the back, I just don't know.

17 This is just a snapshot of one of  
18 the mosaics that we ordered when we ordered our first set  
19 of mosaics. One inch to ten miles. And this little bar  
20 down here shows a distance of one mile. Now I haven't  
21 measured this but if you were to guess, that's one mile,  
22 maybe this is ten miles and that's maybe twenty miles, so  
23 we're looking there, we're looking down at about two  
24 hundred square miles, I would say probably minimum, two  
25 hundred square miles of land surface. This is Point  
26 Separation, which comes into the Mackenzie Delta. And  
27 you'll see these very, very winding sinuous streams in  
28 here on this so-called estuarine delta. In other words,  
29 not too long ago, several thousands of years ago, the  
30 ocean was back here, and now this is built all the way

Messrs. Dau, Williams, Mollard, and  
Watson  
In Chief

1 north of Inuvik up to Nanook and up to the Beaufort  
2 Sea. And this is what Mr. Dau mentioned this morning  
3 when he said M-R-D. This is the Mackenzie River Delta,  
4 and we have a short abbreviated description of that  
5 on the legend as he pointed out on the right, and we also  
6 have a much longer description of the kinds of materials  
7 and the vegetation and what we call the "stratigraphy"  
8 which is layering like a layer cake. It's peat or dead  
9 organic materials at the top, and then silt and so on.  
10 That's part of looking at the total components of the  
11 landscape. Now if you look down here, you can see rather  
12 very vaguely just a little bit of this evidence that  
13 we have out in the front here, where the ice has flowed  
14 down here like that, and sort of given you linear features  
15 very low ridges and the really swales on the  
16 surface, you can hardly see them. You can see the direction  
17 of ice movement.

18 Then back here the ice stagnated  
19 and you get a lot of ponds. These dark thaw ponds, where  
20 you have had melting out of ice, ground ice, in a  
21 sense, these are what we call, "kettle holes", they are  
22 pieces of glacier ice that melted out. And so you have  
23 a whole bunch of sort of, depressions here of different  
24 shapes and different sizes. To me, looking at them,  
25 quite different from thaw features.

26 Now, there's a great deal of  
27 information you can't see at this particular scale.  
28 For example, here right underneath the 's' in five  
29 miles is a little lake, and right inside that lake is  
30 a hill, which is about two hundred feet high, and it is

1 wooded. And that's what we call a "cave" which is simply  
2 a mound of sand and gravel built in contact with the  
3 ice. Now we look at that in our one to two thousand ,  
4 and it is fairly easy to pick out. So, in short, there  
5 is a whole series of things that you can see in lower  
6 level that you can't see here, but this is good for the  
7 broad overview. Giving you a sort of definition of the  
8 boundaries of major changes in the landscape, major  
9 changes in the history, and the materials. Because  
10 ultimately we want to say, how was the material laid  
11 down, how was it made, when was it made, what are its  
12 properties, what do the properties mean to us in terms  
13 of our project? That's the name of the game.

14 Okay, now, that was a government  
15 mosaic that we purchased. And I confess that this isn't  
16 the greatest mosaic, but this was one we made ourselves.  
17 You can see the corner of the individual photographs,  
18 this is the photograph number down here, and we simply  
19 pasted these together. And where they are rather dark  
20 along here, this should be the same tone, if the photo-  
21 graphs were tone matched, but unfortunately the old  
22 original photographs were fairly poor quality, and we  
23 could interpret them quite nicely, but for making a  
24 beautiful picture that looks like one single, instead  
25 of having a patchwork of several. That's what a mosaic  
26 is, you lay several photographs down, so that you are  
27 looking at a long length made up of many individual  
28 prints. And this is what Mr. Dau's window on his  
29 photomosaic is, only much more professionally done.

30 Now, this shows the Old Crow Flats

Messrs. Dau, Williams, Mollard,  
Watson  
In Chief

1 here, and Old Crow down here, the Porcupine River, in  
2 what we call Pediments Slopes. These square shaped  
3 lakes up here in the Old Crow Flats, which are a very  
4 fascinating thing and have been reproduced in several  
5 technical journals. And the same legend, abbreviated  
6 legend on the right. We wanted a shorthand, we couldn't  
7 go into a great deal of detail, but we wanted a short-  
8 hand legend so that you can read it and look over here  
9 and know what kind of materials these are. Fine sands,  
10 silts, over clays, for example.

11 Now, that last picture was a mosaic  
12 made from prints taken from an aircraft flying at about  
13 35,000 feet or 7 miles up in the air. This is the kind  
14 of mosaic we'd like to prepare where you don't see any  
15 lines, it looks beautiful, but really it's an Erts, it's  
16 a satellite image. That is, it's taken from the old  
17 satellite going around the earth and coming back to the  
18 same area every eighteen days and flying or orbiting  
19 the earth at 570 miles above. And giving a scale here  
20 of one inch equals 16 miles, so that this is the Great  
21 Bear River. I can't say that it's real sharp, but to  
22 me it's sort of fuzzy, but I can see the islands in the  
23 Mackenzie River here. I can see Mount Clark in the  
24 end of the McConnell Range. I can still see, even  
25 at this -- I'm going to step off here, before I hurt  
26 myself -- I can still see the direction of the ice.  
27 You see the ice came through here and moved in and  
28 blocked off the valley. This is high on the west side  
29 of the Mackenzie Valley, so the ice simply came in here  
30 moved over/<sup>here</sup> blocked this off, and formed a lake back in

Messrs. Dau, Williams, Mollard,  
Watson  
In Chief

1 the south, toward Black Water, Saline, and those creeks  
2 and rivers coming in from the east. Then the ice came  
3 in here, blocked this off, gave us finer grained lake  
4 bottom material, quiet water, then as the ice receded  
5 out, you had a delta built in here of sands and silts.  
6 Sands just about the size of sugar, and when it dried  
7 up and the ice moved away, ten or fifteen thousand  
8 years ago, the wind came along and picked these grains  
9 of sand up in the air and blew them into dunes, sand  
10 dunes. You couldn't make a sand dune up there now at all  
11 but at that time the conditions were just right, like  
12 they are now in California and places in Southern  
13 Saskatchewan for building dunes.

14 Now, we'll look at one of these  
15 slides, in this little area in here at a lower level,  
16 and you can see an entirely different type of detail.  
17 So this is what we call a "band" -- let's see, "band  
18 six" which is in the near infra red. It's not even  
19 in the visible. This picture isn't taken in the rainbow  
20 which we see from violet to red, it's taken beyond the  
21 visual, in the infra red, photographed in infra red.

22 Okay --

23 MR. GENEST: May I ask, so what?

24 DR. MOLLARD: Well, yes, okay.

25 May I say, hear, hear. You mean about the infra red?

26 Q Yes.

27 A Well, it really --

28 Q I have trouble enough  
29 understanding all this without throwing curves at me.

30 A Yes, well, shoot the curves.

Messrs. Dau, Williams, Mollard,  
Watson  
In Chief

1  
2                   The advantage of an infra red, and  
3     I had four and I picked this really because to me, it  
4     was a little clearer. But what the infra red does  
5     it highlights the drainage, where you have a water table  
6     near the surface, you have creeks, where you have ice  
7     breakup, in other words, if I am doing a study now in  
8     the North of ice-breakup in river, and I've ordered all  
9     of this same band that we looked at showing the ice-  
10    breakup in the rivers when it occurs, because it shows  
11    water black, and it shows ice and snow white. And of  
12    course it goes around and you get the same area every  
13    eighteen days, if you don't have cloud. So that is one  
14    of the advantages of the infra red. Shows your wet  
15    areas, and it also can accentuate the coniferous  
16    versus the deciduous vegetation.

17                   Now, this is an area just south of  
18    Wrigley, and this is coming down from 700 -- what did  
19    I say, 570 miles -- down to about 7 miles. This is the  
20    kind of photograph that I like to look at early in the  
21    study, because as you can see here, this is all vegetated  
22    and this is quite heavily vegetated in here. Quite tall  
23    trees, but still they are massed, because you can  
24    imagine being seven miles up, the trees look like grass.  
25    I look at this in three dimensions. It stands up, the  
26    valleys go down, and the rivers or the hills stand  
27    up in the air. You can see here that there is a suggestion  
28    of where this ice moved into the valley here, opposite a  
29    river between two mountains. It came in around Willow  
30    Lake river, moved into the valley, down about to, about

Messrs, Dau, Williams, Mollard  
Watson  
In Chief

1 and slightly beyond River Two Mountains, where it  
2 started to melt.

3 So here is another block in the  
4 valley, and between here and the last one I showed  
5 you is where we had a lake up to about 900 feet.  
6 Quite a bit of silt and clay deposited in it. Now, this  
7 is what we call a "panchromatic" or black and white  
8 photograph. And I suppose 99% of our work is done with  
9 black and white aerial photographs.

10 But the next shot is going to show  
11 this little area, if you look at this little gully  
12 coming in here, and these islands here, I'll show you  
13 a colour infra red. What a colour infra red does for  
14 us, and there is only one flight line down the  
15 Mackenzie Valley, flying at about a scale of about  
16 one to fifty thousand, which is a little bigger than  
17 one inch to one mile scale. One flight line, but what  
18 it does, is that it shows the stress in vegetation.  
19 In other words, we don't what is stressing the vegetation,  
20 it might be high salt content, it might be very, very  
21 shallow distance to rock and the roots can't get into  
22 the rock, it might be the permafrost table, the roots  
23 can't get down into the ground because it's frozen,  
24 and that is stressing it. So the plants aren't  
25 vigorous, they're not healthy. So anything that  
26 stresses the vigour of the plants, in other words, you  
27 give the willows and the paper birch a little thicker  
28 zone, and the roots can go down and they respond and  
29 they come out pink, and we'll take a look at that in  
30 the next photograph.

Messrs. Dau, Williams,  
Mollard, Watson  
In Chief

1693

1                   You see here is a little thicker  
2 layer, it's thawed a little bit deeper, these are a  
3 little happier plants than these over here, because  
4 they can put the roots down. Now we come out in an  
5 island in here, and I don't know whether that's sharp  
6 there Lee? It looks a little fuzzy there. That's  
7 better.

8                   You can see, you have the Mackenzie  
9 River. This is just south of Willow, or Wrigley. The  
10 river water has been flowing around here so the  
11 willows on these islands in the river are thawed and  
12 they are responding by giving you this tonal difference.  
13 We just had a narrow band, and the flight lines started  
14 about the Sans Sault site, and ended about the airport  
15 at Fort Simpson, so there is just one band down there.  
16 But we found them helpful, because we were going along,  
17 and we'd say, "well, the thaw depressions look different,  
18 north here, around, River between, or between Around  
19 Mountain, Mountain River. There possibly the permafrost  
20 is coming in, we're getting more permafrost along the  
21 little pond ." But now, we come down here around  
22 Hodson Creek and Willow, it looks as though the permafrost  
23 is melting out, and that the little lakes are getting  
24 larger. They're swelling rather than shrinking in size.  
25  
26  
27  
28  
29  
30

1 Q Excuse me, Dr. Mollard,  
2 do I take it then that what this shows you is that it  
3 gives you information of what you are likely to find  
4 underneath that surface?

5 A That is right in terms of  
6 permafrost, it is simply one more tool that is very  
7 inexpensive, that you can buy from the Government,  
8 at a very small expense for a bout a dollar a print.  
9 And they are high level, so you do not have to buy  
10 very many of them.

11 I will not go into this  
12 slide, but it simply shows the exercise in terms of  
13 stages. The black line is where I visualise the  
14 ice front and this is the exercise that I went through  
15 in time, in space, because we have to think in four  
16 dimensions. Where we are in space and in time and  
17 this is what I was doing here, trying to find the  
18 blue areas, which are the old lakes which are now  
19 drained, so that when we looked at the air photo,  
20 just like they say, "It's Tuesday, this  
21 must be Brussels", if we are between Black Water  
22 Creek and Wrigly and we are below elevation 900 we  
23 should be in this kind of material. That is what  
24 that exercise is about briefly, okay.

25 Q Right.

26 A This was a map, a  
27 very, very general map of the valley that I prepared  
28 where we have many, many different types. I simply  
29 show this in terms of five. Green being the bedrock --  
30 green being the bedrock in here. The blue -- this is

0 There is some things that

1 I know.

2 (LAUGHTER)

3 A This is the Mackenzie  
4 River and this is just south of Fort Norman and we  
5 are coming down now so that we have got a little  
6 lower look at the thing. The lakes look a little  
7 sharper, these are thermokarsts. This D.L. stands  
8 for, it is an old delta, so that we have a layer of  
9 this fine sand and one of the clues, you are always  
10 looking for clues as to what the material is,  
11 in other words,,if I put my pointer down there and I  
12 say, what do I guess for starters that material is  
13 below the moss and peat cover there? What kind of  
14 material, if I took an auger and went down there  
15 four feet, what would I strike? What would I strike?  
16 Can I guess the kind of material? Well, if you  
17 have had a little bit of experience you can say  
18 yes, I can guess and I can guess quite accurately,  
19 because here we are just seeing this side --  
20 you see, these are long sand dunes that run for  
21 miles in this direction, big things that show up  
22 very sharply and they are very obvious to the photo  
23 interpreter. But what are sand dunes? They are  
24 wind carried, deposited by the wind. The wind can  
25 only carry material between about a tenth and a half  
26 a millimeter, that is from a very, fine, fine salt  
27 to about a medium coarse sugar. That is the kind  
28 of material it carries, so if I have gravel here  
29 I could not build sand dunes from the wind. If I had  
30 ice laid material, like I told you, boulders and so

Dau, Williams  
Mollard, Watson  
In Chief

1697

1 on, laid by the ice, I could not build it.

2 So this occurrence of these  
3 materials tells me what I expect to find here and  
4 this is a little slide failure along the bank, so  
5 these are deltane deposits, silts and fine sands  
6 with thermokarst, these will thaw, these are not  
7 glacier ice areas where a chunk of glacier ice got  
8 buried and then melted out, these are actually  
9 permafrost bodies of ice that have melted out.  
10 Okay, I do not think that I have too many more  
11 here.

12 This comes back to the  
13 picture outside the door here, where you have  
14 these smooth ridges, they look like cigar shapes here  
15 and that is where the ice moved over and underneath  
16 the ice as it overrolled the soil, mixed it all up just  
17 like a big bulldozer, it sort of streamlined the  
18 surface and when I look at this I say, "That is not in  
19 a lake bed, that is shoved in by the ice. It has  
20 got a different moisture content, a different density,  
21 it has got a different permeability than your  
22 lake laden materials." So, it has different geotechni-  
23 cal properties.

24 Now, you can look outside  
25 and instead of soil you will see the same thing here  
26 on exposed bedrock. Now, over here you will remember  
27 that I said the abandoned railway grade where the  
28 ice moved into the empty valley and all of a sudden  
29 it stopped, melted. The sun came down and it started  
30 to retreat, but there was probably a crack in the

Dau, Williams,  
Mollard, Watson  
In Chief

1698

1 ice and down the water went into the crack and down  
2 along underneath the ice in a tunnel and formed  
3 this little, wiggly ridge here which is maybe ten  
4 to 20 feet high of sand and gravel, enclosed as it is  
5 in the ice, so it has ice around it and then when the  
6 ice melts away it collapses, so you get broken  
7 beds and of course if it is the spring of the  
8 year, there is a lot of flow, you get gravel. If it is  
9 in the wintertime, there is not much flow so you get  
10 very fine materials, there is nothing forced to carry,  
11 We will take a look at what this would look like if  
12 we just took a great big cleaver and we hacked through  
13 that ridge, which is 20 feet high, what would we see,  
14 okay.

15  
16 This is the kind of thing that  
17 we would see. See the gravel, probably the spring,  
18 larger flow, here is a bed of silt, in fact there it looks  
19 as though there is a little organic material, <sup>maybe</sup> there was  
20 a little growth there for a time, or maybe growth in  
21 the land, if there was vegetation growing on the  
22 top of the ice as there sometimes is and it is washed  
23 in, here gives you a little darker band, but you will  
24 notice that this queer mixed up mess and this odd  
25 shape, looks like a layer cake with a bit of a twist,  
26 it has collapsed, so that you have got to be very  
27 careful when you put a hole down and you are looking  
28 for gravel, and I suppose we tested over 500 of these  
29 over the years. One hole can be misleading,  
30 but if you have tested a few hundred you know the general  
range and the complexity of these materials. They are

1 fine for certain uses, but no self-respecting con-  
2 crete contractor would ever look at one of these  
3 deposits and if he could get coarser and better, cleaner  
4 material.

5 Okay, that shows an esker.

6 Now, this is rather interesting because it is not  
7 collusion. Mr. Dau presented the picture, if you  
8 remember the one he showed to explain the terrain  
9 typing. This is the same area and I sited this one  
10 in Regina, as I say, one of 18 out of 250 slides and I  
11 did not know which one -- or I did not even know the  
12 sheet that he was selecting, so, that is maybe mental  
13 telepathy, but I just want to take a minute  
14 on this because what you have here is a fan shaped  
15 deposit coming down the Mackenzie Valley.

16 Now, if you have looked at  
17 a lot of photographs in a lot of areas, most of your  
18 alluvial fans are sand and gravel. We call these  
19 "C" for coalescing alluvial fans. We use the first  
20 letter on each so that we can remember them fairly  
21 easily, but what has happened here is that  
22 you have very steep sided basining here, It is like  
23 a great big bowl, very steep rocks and they are soft  
24 rocks, they are silt stones and shales, that is compressed  
25 silt and compressed shale. These are 60 million years  
26 old, these rocks, but they are exposed in a harsh  
27 climate. It is cold and there is a lot of freezing and  
28 thawing and these steep slopes shed material down the  
29 slopes like this and then you get a run off in the  
30 spring and the rain washes all this material out and

1 where does it deposit it? It deposits it on a fan.  
2 And it has been doing that for thousands of years.  
3 What do we see on the surface? We see vegetation,  
4 so we get growth and decay. That gives us organic  
5 material. so, if we put a hole down there we would  
6 say this stuff is weathered here into "fine materials."  
7 It is washed out here, as basically silt and some  
8 very fine sand, deposited along these stringers, it  
9 is growing up year after year, the old deposit, a  
10 hundred years ago is now buried and it had grass  
11 in it, sedges, so that decayed and we get  
12 organic silt and that is how we look at this.

13 Then we say, well, in this  
14 environment it has also got ice in it. So it is an  
15 ice rich organic silt. Now, you cannot tell from  
16 drilling really where these little bodies of ice are,  
17 because they are like raisins in a cake. You know there  
18 are a lot of them, you know generally the dimension,  
19 but it is like looking down on a cake pan with icing  
20 on it and you have got a toothpick and you say, "There  
21 are a lot of raisins in that cake", these are the  
22 bodies of ice, where are they? And is it important  
23 that we define everyone and the shape? The thing  
24 is to get an idea of whether there is little ice  
25 or a lot and whether it is rather randomly distributed  
26 and what kind of ice it is in the sub-surface.  
27 Okay.

28 Now, I will just take a  
29 very short time and this is the terrain legend that  
30 we have prepared on volume two. This has been supplanted

1 by a later one because of route additions and so  
2 on, but we were interested in the landform depositional  
3 environment, this is what I have been talking  
4 about, how it was deposited, this gives us the relief--  
5 is it a ridge or a valley or a flat plain or a depression.  
6 Stratigraphy, this is layering: is there one layer  
7 over another. In other words, is there gravel over  
8 clay over sand and so on -- or is there peat over  
9 clay? These things have construction implications  
10 in terms of construction and maintenance. I cannot  
11 assess the implications too well. I can get a good  
12 idea what I think, but this is really a pipeliner's  
13 problem with a great deal of experience in pipeline:  
14 How do you design, how do you construct it, what  
15 are the problems, what are the costs and so I simply  
16 look at these things and map them and somebody else  
17 puts the implication from these pipeline investigations.  
18 Not only engineering, but environmental.

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1                                   A       Permafrost vegetation  
2       then I thought if I was going to do this I should have  
3       an aerial photograph in there so that you could look  
4       at it in 3-D, then test holes, whether we had two or  
5       three or 20, this is quite old, I suppose this slide  
6       is maybe four or five years old, but we went through  
7       the whole corridor doing this, anticipated engineering  
8       characteristics of drainage                                   and then  
9       columnar profiles, what we visualize, the  
10      range of depth because anybody that's done an awful  
11      lot of drilling, especially in routes, you know that  
12      you can have a terrain type and it's got uniform  
13      properties but you put a hole down here maybe five  
14      feet and you go over here and maybe 500 feet, it's  
15      ten feet and so on, so there's a certain expected  
16      variability or a little rhythm to that terrain type so  
17      you have to capture it and that's what we tried to  
18      do in the profile.

19                                   O.K., so we wanted to say  
20      really a little more than this. We wanted to say, this  
21      was the one we were looking at, where we had the  
22      coalescing alluvial                                   sand, low gradient sands,  
23      less than one degree coalescing icebergs, silty  
24                                                                                   Mountains  
25      textured sands all over the Richardson /                   and so on.  
26      The land form, how they were made, and I went through  
27      that.

28                                   Then specificity one or  
29      two feet over these organic and inorganic silt and  
30      silty, very fine sand. That's the bulk of the material  
    in those bands.                   Then the permafrost, the zone, this

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 is off Roger Brown's permafrost of Canada mean annual  
2 temperature, active layer and so on, this material is  
3 from drilling and from records and old reports that  
4 we had and so on that we had to go by.

5 So here land form, decomposi-  
6 tional environment topography and permafrost  
7 underlying, incidentally, its -- you see, this has  
8 got to cover an area, in other words you start at a  
9 location in the north and you go 50 miles or 100 miles  
10 south, so that you may go across a boundary, one of  
11 Roger Brown's boundaries on his map, and continue  
12 and discontinues, so this means it's wide-  
13 spread, this means that there are isolated occurren-  
14 ces and these other says that there aren't  
15 any available or very little. O.K.

16 Topography, the same thing,  
17 naturally those are finite, the small things are  
18 very, very small, vegetation is light density and  
19 so on. The aerial photo features the same  
20 engineering characteristics --  
21 and slope stability and the general first look at the  
22 thing -- settlement, excavation type, drainage,  
23 classification.

24 This one shows the kinds of  
25 material, and I would say probably that's the minimum  
26 depth on this side, and this is the maximum depth and  
27 this is the peak /and this is the ground ice condition  
28 that one would expect to see if you went down the  
29 surface. Now notice there's quite a long range here  
30 so that most of your holes down 10 or 15 feet will

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 be in this material. If you look at the next one, I  
2 think the last slide -- can you get the next one --  
3 it shows quite a significant range of peat. This  
4 is fairly thick peat over lake bed materials, old  
5 lake bottom materials, sand, silt.  
6 You'll see quite a range in this second layer and  
7 it's over a third. We have three different materials  
8 with different layers and when you're test-drilling  
9 you've got to be very careful visualizing what you're  
10 test-drilling is doing. You've got to understand your  
11 material as best you can because you can put in holes  
12 every 500 feet and think, "Boy, those are really closely  
13 placed, and I know what's there," and then put in a  
14 hole in between them and find something slightly  
15 differently. The thing is, is the difference significant  
16 in terms of what you're doing? Do you have to know  
17 precisely after it's <sup>at</sup> a certain stage, then it probably  
18 doesn't matter in terms of design.

19 O.K., that's the simplest --  
20 I think that's my last one, isn't it? Yes.

21 Q Mr. Mollard, I take  
22 it then that this gives the pipeline engineer an  
23 accurate idea of the type of terrain he is likely to  
24 encounter along the band of terrain that he has  
25 selected, by the process explained earlier by Mr. Dau,  
26 he's narrowed it down by map studies and so on,  
27 flying over it, to a band of terrain. How do you --  
28 I take it these are conclusions drawn from your  
29 study of the features and the process you've just  
30 described -- how do you test the veracity or the

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 accuracy of the inferences that you've drawn?

2 A Well, you put in a  
3 number of holes and test them. For example, in a sand  
4 dune I'd think twice about putting a hole in it, you  
5 know, the number I've seen because I've tested hundreds  
6 of them so <sup>it is</sup> if/ a cost thing you put them into terrain  
7 which is a little more variable and which you would  
8 expect a little more variation. But in this particular  
9 project, starting back, we had a whole series of  
10 holes and then later on we added to them and then  
11 latterly the Department of Public Works has put in  
12 something like 7000 holes so these were used to verify  
13 the terrain typing that I had done, and I think just  
14 looking back, I was looking at some yesterday morning  
15 in Calgary, where you know, you go from 800 holes to  
16 7,000 or 8,000, and I can't say that my impression of  
17 the terrain units changed substantially with that  
18 increased drilling that was done. It was basically  
19 much the same.

20 Q So the data that you  
21 got confirmed that your typing was accurate.

22 A Well, I'd say I think  
23 it's acceptable from my standpoint. I think it's good.  
24 You see, I look at it as a person that's looked at  
25 many of these and tested many of them in the field  
26 and so on, and I want to derive a given level of  
27 accuracy that's useful and desired and necessary for  
28 the project.

29 Q Right.

30 A At a given stage, and

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 think this is, and that's how I look at it, because,  
2 you know, I've been on projects where we've done five  
3 or ten drilling programs lasting ten years, and you  
4 get more and more information; so at the stage and the  
5 intent of the job, what it was designed for, I think  
6 the level of accuracy is quite good and I think it  
7 matches the other maps of the Mackenzie Valley that  
8 I've seen prepared by other people quite well.

9 Q Mr. Dau, now how do you  
10 use that information that's provided by Dr. Mollard's  
11 methods in specifically route selection? I know it  
12 covers other matters as well, but how does it assist  
13 you in placing your route?

WITNESS DAU:

14 A Well, it is one of the  
15 many considerations used in selecting routes. The different  
16 terrain types and their characteristics, as Dr.  
17 Mollard has described, are assessed with respect to  
18 their construction difficulty or with respect to  
19 their performance after they have been disturbed due  
20 to construction, or with respect to the maintenance  
21 problems that may come up after the pipeline is  
22 built, and you can't eliminate all of the problems.  
23 You have to optimize your route. Maybe I can explain  
24 that.

25 Dr. Mollard may be able to,  
26 for instance, identify to us the areas in which muskeg  
27 was five feet deep on an average. He may be able to  
28 identify areas where muskeg is 20 feet deep. We  
29 would obviously prefer to be in a shallower muskeg  
30 if we have to cross muskeg. But that may add

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 significantly to the length of the pipeline. You have  
2 to balance the additional cost in going through the  
3 deep muskeg against the increased length of the route  
4 which is a cost by missing all the deep muskeg, and  
5 these have to be in balance.

6 Q I take it there are  
7 also environmental concerns --

8 A Yes.

9 Q -- and other concerns.

10 MR. SCOTT: I would prefer  
11 that the witness give the evidence.

12 THE COMMISSIONER: Well, I  
13 think that was assumed. I would be surprised if the  
14 witness 's answer had been "No."

15 MR. GENEST: I will bear that  
16 that objection in mind. I ;will try to be non-leading.

17 Q Would you then describe,  
18 Mr. Dau, how environmental and socio-economic consul-  
19 tants retained by the Arctic Gas Group and the  
20 Environmental Protection Board participated or  
21 contributed to the process of route selection?

22 A Yes, they were provided  
23 with maps and photomosaics of the route selected by  
24 the location engineers as a basis for their environ-  
25 mental studies. As both engineering and environmental  
26 studies were in progress, periodic meetings were held  
27 with representatives of both groups to discuss work  
28 progress and mutual concerns. In April, 1973, a  
29 week-long seminar was conducted, at which a mile by  
30 mile examination of the route as then proposed was made

Messrs. Day, Williams, Mollard,  
Watson - In Chief

1 by all parties concerned. The environmental and socio-  
2 economic groups suggested route modifications and  
3 commented on sensitive areas where special precautions  
4 would be required. After a discussion of the pros and  
5 cons by all individual groups, the route location was  
6 altered in many instances, to take into account special  
7 concerns and special construction and operation pro-  
8 cedures were noted for other areas.

9 Q Does the present route  
10 reflect the modifications that were made as a result  
11 of comments and suggestions by these consultants?

12 A Yes, it does.

13 Q Would you tell us --  
14 could you illustrate that?

15 A There were numerous  
16 modifications of the routing, the design and the  
17 construction schedule or construction plan. Many of  
18 these reflected the concerns of the vegetation and  
19 geotechnical advisors who were on the staff of  
20 Northern Engineering, and with whom the engineers had  
21 almost daily contact. Major modifications, together  
22 with the manner in which environmental and socio-  
23 economic factors received consideration are set forth  
24 in Section 8(a)(i) on pages 427, and Section 14(d),  
25 chapters 1 and 6, and 14(e) -- and this one with  
26 respect to the interior route alternative, of the  
27 material that has been filed.

28 Q Well, they are there  
29 and I won't take you over them. We would just be  
30 repeating them by reading them out loud.

A Yes.

1 Many minor changes were  
2 made to satisfy concerns that were expressed on bank  
3 and slope stabilities, creek and gulley crossings  
4 and thermokarst areas.

5 Q You have some examples,  
6 do you?

7 A Yes, referring to align-  
8 ment sheets, the first alignment sheets is 1C -0200 -  
9 1003. On this particular alignment sheet the route  
10 was relocated in two locations.

11 Q Do we need to look  
12 at the alignment sheet to get the message, Mr.  
13 Dau?

14 A The second example  
15 I am referring to happens to be the one that I used  
16 on the slide if that would --

17 Q Let's just have what you  
18 did with the first one -- that 1003, without looking  
19 at it , tell us what happened.

20 A There was a change made  
21 to avoid a poor gully crossing. The total route  
22 relocation was 3.3 miles long and it added no sig-  
23 nificant length to the route.

24 The second change was to avoid  
25 slumping ice wedge polygons on the banks of the  
26 Malcolm River and it was about 8 and a half miles  
27 long and added about 500 feet to the line length.

28 The second alignment sheet  
29 I am using as an example, as the one that we had  
30 previously which is 1C - 0200 - 1015, and the

DAu, Williams,  
Mollard, Watson  
In chief

1709

1 pipeline route there was altered to avoid some  
2 poor bank conditions on the Willow River and I have  
3 pointed out the location of the Willow River. This  
4 change is about 1.3 miles in length and in this  
5 particular instance, it shortened the line by about  
6 100 feet.

7 THE COMMISSIONER: Excuse me,  
8 Mr. Dau, I am looking at that alignment sheet and  
9 is the earlier route the route that was altered after  
10 consultation with the environmental advisors. Is the  
11 earlier route marked?

12 A No, sir, it is not.

13 MR. GENEST: Perhaps we can  
14 illustrate that on Mr. Dau's slide.

15 A I think Mr. Watson is more  
16 familiar with this. He could probably indicate the  
17 exact change that was made.

18 MR. WATSON:

19 A First of all I might  
20 say that this was not totally an environmental  
21 concern. The environmental concerns that Mr. Dau  
22 mentioned earlier were listed in the exhibit 8 (a).  
23 These are a couple of examples of group changes that  
24 were made, but not specific environmental concerns --  
25 they were mainly geotechnical concerns and this  
26 particular instance it was a very minor route change  
27 The original routing across the -- a little  
28 bit further down, after we --

29 Q You are indicating to  
30 the west of the black line that is --

1 A I am indicating to the  
2 west of the black line.

3 Q What distance?

4 A Well, probably in the  
5 neighbourhood of five to six hundred feet. You will  
6 notice from the profile here there is a bank that  
7 we run down from this ridge of / <sup>knoll</sup> marine surface down  
8 into the bed of the river itself.

9 Q Could you speak up a little  
10 -- I am sorry, -- speak into the microphone --

11 A Yes.

12 Our alignment prior to making  
13 this minor route change in this instance, was about  
14 where I am showing it here, west of our present align-  
15 ment. From the profile you will note we dropped down  
16 from this ridge and knoll marine here down into the bed  
17 of the river. This slight readjustment gave us a bit  
18 of a better access to the river bed and it is also a bit  
19 better crossing and as it actually shortened the  
20 line by a little bit it is pretty obvious we should  
21 have been there in the first place and this came from  
22 studying the route after the preliminary alignment was  
23 done on it and we are continuing to do this and  
24 probably as more information becomes available, we will  
25 be making more minor corrections like this.

26 THE COMMISSIONER: Well,  
27 I do not want to belabour this, but was there any  
28 specific reason for making that change other than  
29 it shortened the line?  
30

A Yes, the crossing of

1 the Willow Lake River is slightly better where it  
2 is located then where we had located it in our  
3 previous alignment.

4 Q Why is it better?

5 A There is a bit of  
6 localized bank instability where our initial line  
7 was.

8 MR. GENEST: These, sir,  
9 were given as examples of minor changes made to  
10 satisfy concerns on bank and slope stabilities.  
11 The major examples are -- as to environmental and  
12 socio-economic factors are those listed in the  
13 application. Perhaps I could -- I said I would skip  
14 over -- but perhaps for the benefit of those here,  
15 those here <sup>who</sup> are not familiar with the contents of the  
16 application, I might go to those. The application  
17 materials list instances ~~where~~ modifications were  
18 made to avoid fish breeding grounds and so on.  
19 Could I deal with those or --?

20 THE COMMISSIONER: You  
21 suit yourself. You might give us one or two  
22 examples. I -- this is a public hearing and it is  
23 not just for the benefit of counsel and myself,  
24 but those members of the public attending as well.  
25 I -- forgive me for asking all of these questions,  
26 I just want to understand these things when we are  
27 looking at them --

28 MR. DAU:

29 A We have the other  
30 example that I mentioned. We have it on a slide if you

1 would like to see that , sir.

2 THE COMMISSIONER: Yes,  
3 please.

4 A This is alignment sheet  
5 1C - 0200 - 1003. That is the one that I previously  
6 referred to, and the location at the Malcolm River.

7 MR. GENEST:

8 Q Where is that in the  
9 book, can we find it in the book, Mr. Scott? Have  
10 you got it?

11 MR. WATSON:

12 A Well, this alignment  
13 sheet-- we made a --

14 MR. GENEST: Just a moment,  
15 it is just twelve pages from the previous one we  
16 were all looking at.

17 MR. SCOTT: Why doesn't this  
18 book have pagenumbers?

19 All right, we have it, thank  
20 you.

21 MR. GENEST: The numbers are  
22 in the right hand corner.

23 A All right, we made two  
24 route realignments on this particular sheet as a  
25 result of geotechnical review. The first one was  
26 in this small gully, here.

27 Our previous routing  
28 crossed very --

29 Q You are indicating the  
30 mozaic at the left hand edge of the page --

1 A This is the left hand  
2 edge of the page --

3 Q Right --

4 A Our previous alignment  
5 passed slightly to the south of where the present  
6 alignment is shown. There is again an instance  
7 of eroding gully banks on this small gully here.  
8 We have made a slight readjustment to the routing  
9 which kind of got around that problem?

10 Q You moved it to --  
11 on that one, the top of the page is north? Is it?

12 A That is correct.

13 Q And you moved the pipeline  
14 to the north to avoid the bank?

15 A Right.

16 That did not add any appreciable  
17 length to the pipeline route.

18 Q Well, then let me go back  
19 to the -- Oh, is there another change on that? I  
20 am sorry.

21 THE COMMISSIONER: Excuse me,  
22 before you proceed, you said move the pipeline to the  
23 north-- have I missed something here?

24 MR. DAU: This happens to  
25 be along the coast, sir. This is farther west.

26 MR. WATSON:

27 A This particular sheet  
28 is located on the north slope here, just about 30  
29 miles from the Alaska/Yukon Border.

30 MR. GENEST:

Dau, Williams,  
Mollard, Watson  
In Chief

1714

1 Q Well, Mr. Dau,  
2 could I -- I think, are we -- oh, no -- you are going  
3 to illustrate --

4 MR. DAU:

5 A There is one more if  
6 I could just quickly mention this other change. This  
7 is the Malcolm River along here and our original  
8 routing in this area came down in this general area  
9 past to the south. Subsequent investigation after we  
10 had located the route there indicated that there are  
11 slumping ice wedge polygons on the bank of the  
12 Malcolm River in this area.

13 Q That is to the south  
14 of the present line as indicated.

15 A That is correct.

16 So the line was rerouted to  
17 the north of that feature. This added about 500  
18 feet to the line.

19 Q All right.

20 A This sheet also  
21 shows a compressor station which is located immediately  
22 on the right bank of the Malcolm River. In this  
23 instance the ideal location for the station would  
24 have been in the middle of the river, but that is  
25 not really a good place to have it so it was moved  
26 to the right bank.

27 Q When you say "ideal"  
28 you mean from a --

29 A This is from a hydraulic  
30 gradient --

Q Right.

Well, then can we turn off  
that machine and I would like to go back to the  
statement by Mr. Dau and ask Mr. Dau, you said that  
some major modifications brought about by environmental  
or socio-economic factors were made to the line and  
these are set out in Sectgin 8 (a) 1, pages 4 to 7  
of the application, Section 14 D, chapters 1 and 6  
and then in Section 14 (e) with respect to the  
interior route alternative -, could you highlight  
these for us, please?

Messrs. Dau, Williams, Mollard  
Watson - IN Chief

1 They are summarized on Appen-  
2 dix "A" . I think the major one, of course, is the --

3 Q Appendix "A" of what?

4 A This is 8(A) (i) of the  
5 appendix of Section 8(a) description, it's on page  
6 8.

7 Q Page 8?

8 A Right. The major one  
9 here, of course, is the major revisions that were  
10 made in the Travaillant Lake area as a result of  
11 environmental concerns.

12 Q Did Mr. Williams point  
13 that out where that is on the map? Although I think  
14 we all know where Travaillant Lake is by now. Got  
15 your pool cue, Mr. --

16 A The original routing  
17 crossed areas of high productivity for mammal, fish  
18 and birds. The change is to the -- it was proposed  
19 that a change of routing to the east or west be  
20 examined to find something that was much better.  
21 The Travaillant Lake junction was re-located 15 miles  
22 to the south-west.

23 Q So originally it  
24 was to the north-east of where it's shown, that was  
25 the original plan, was it?

26 A Right.

27 Q And the concerns of the  
28 environmentalists about -- how that would have affect-  
29 ed the animal life, do you recall?

30 A I don't recall the

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

specific details.

WITNESS WATSON: I think the main concern was located at a number of lakes, particularly where Mr. Williams is pointing there, to the north and west of Travaillant lake, and the line passed through these, it was just a question of the proximity of the pipeline maybe having an adverse affect and it was felt that if the line was moved out a bit, out of that high productivity area it would benefit.

WITNESS DAU: The line section from Campbell Lake was located about 20 miles west of the original route and also from Travaillant Lake junction to Thunder River crossing there would be re-location involved as much as seven miles of movement. In addition, the Mackenzie River crossing north of Arctic Red River was moved several miles downstream because of an environmental concern. In this area it was to avoid rare and endangered species nesting area.

MR. SCOTT: Mr. Commissioner, perhaps it wouldn't be out of order to ask Mr. Genest as he has highlighted that, when and if the cross-over is filed, that they remind us again of the effect of a cross-delta route on that particular section?

MR. GENEST: That's right. I have not proposed to deal with this panel, with the cross-delta route. What I hope to be able to file very soon -- and I hope to be in a position to tell

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 the Inquiry in a few days as to when exactly but very  
2 soon, a full set of materials with respect to cross-  
3 delta, and I felt -- and I hope you agree, sir -- that  
4 to deal with it now without all the backup information  
5 would be <sup>a</sup>repetitious exercise. We have to go all into  
6 it again when we have the materials at hand. So I've  
7 deliberately stayed away from that so if my friends and  
8 Commission counsel can all have an opportunity to --  
9 and of course their advisors-- give them an opportunity  
10 of looking into that, I thought it would be much more  
11 organized if we looked at that separately and everybody  
12 was armed with the materials necessary to look at it.  
13 But I certainly note Mr. Scott's comments.

14 MR. SCOTT: Well, Mr. Commis-  
15 sioner, I am entirely satisfied with that, but this is  
16 put forward as an example of an environmental modifica-  
17 tion that has been made in the event that the cross-  
18 delta route leads to the cancellation of that environ-  
19 mental modification. I wouldn't want anybody to be mis-  
20 led and perhaps when we get to that Mr. Genest will  
21 simply have in mind that he should refer back to this  
22 environmental concern.

23 MR GENEST: Sir, I'm not  
24 following Mr. Scott.

25 MR. SCOTT: I will tell you  
26 later.

27 MR. GENEST: Get me out in  
28 the hall.

29 THE COMMISSIONER: Well,  
30 just a couple of things. This panel will deal with

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 the change in the route of which we were advised some  
2 months ago --

3 MR. GENEST: At Fort Simpson.

4 THE COMMISSIONER: At Fort  
5 Stimpson.

6 MR. GENEST: Yes sir.

7 THE COMMISSIONER: Well, have  
8 you another panel on the proposed change?

9 MR. GENEST: Oh yes, sir.  
10 There will be a full panel probably consisting of  
11 many of the same people, but I thought that without  
12 the materials at hand, it was idle to pursue that  
13 subject. We'd just have to start it all over again.

14 THE COMMISSIONER: Counsel  
15 might bear that in mind, that if there are any second  
16 thoughts about that, we'd better hear about them  
17 early tomorrow morning.

18 MR. ANTHONY: Mr. Commissioner,  
19 may I ask just one question? I think this bears on  
20 the point Mr. Scott was raising. Do I understand  
21 correctly that there is going to be a cross-delta  
22 route proposal put forward, but you don't propose  
23 discussing it now?

24 MR. GENEST: Yes, I have  
25 to give to this Inquiry, to the participants, full  
26 materials about the cross-delta alternative. The  
27 studies are being put together now. We are, I think  
28 and I can only say "I think" at this moment, that  
29 we will be asking the Inquiry to look at it as an  
30 alternative, as a feasible alternative. We have

Messrs. Daw, Williams, Mollard,  
Watson - IN Chief

1 still some concerns to be answered on the cross-  
2 delta route, but we certainly want and would like it  
3 studied by this Inquiry and have our witnesses cross-  
4 examined on it.

5 MR. ANTHONY: I'd like to  
6 clarify in my own mind at that time, which we anticipate  
7 will be a fairly short period of time, that people  
8 such as Mr. Dau and Mr. Mollard will be discussing  
9 the use of the techniques that we heard about this  
10 morning as it relates to the other route?

11 MR. GENEST: Yes, yes, and I  
12 should say we are going into situations, I think  
13 you anticipated them in your ruling, sir, that we're  
14 going to have to call people back, we realize that,  
15 and we intend to be co-operative to the limit of our  
16 ability. All these people are available, and they'll  
17 be back.

18 THE COMMISSIONER: Yes, I  
19 think we all appreciate that. Just before we leave  
20 this cross-delta route, while Mr. Williams is at the  
21 board, Dr. Williams, can you just trace --

22 WITNESS WILLIAMS: Mr.  
23 Williams, an endangered species.

24 THE COMMISSIONER: -- can  
25 you just trace the cross-delta route for our benefit,  
26 just come along, if you would come along the prime  
27 route and just point out where you leave the prime  
28 route to go across the delta.

29 A O.K., the mike is on  
30 now. The prime route, of course, with respect to

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 the Canadian portion, originates at the Alaska-Yukon  
2 border and through there throughout this area it would  
3 not change until we get down to the Shingle Point area,  
4 at which it would break northward from the prime route,  
5 roughly here with a 4 1/2 mile crossing of Shallow Bay,  
6 on across the southern end of Langley Island, across  
7 several channels of the Mackenzie onto Richards Island  
8 at approximately this location. Then the intent would  
9 be to alter the supply leg from the Mackenzie Delta,  
10 using the same origin, coming down the west side of  
11 Richards Island to a junction point about here, with  
12 the Prudhoe Bay supply line continuing to this  
13 same junction of the Parsons Lake supply line, and  
14 following the same route to -- past Inuvik, approximately  
15 here, and then taking a more direct route to the east  
16 side of Travaillant Lake to join the originally filed  
17 prime route at about Thunder River. That, of course,  
18 would eliminate the section of the route to the west  
19 side of the delta, past Fort McPherson, Arctic Red,  
20 and so forth.

21 MR. ANTHONY: Mr. Commissioner,  
22 may I make a request that Mr. -- when Mr. Genest's  
23 assistant this evening arrives with ladder and pen  
24 to put in the interior route, perhaps he could also  
25 put in the cross-delta route so we have the various  
26 information for us.

27 MR. GENEST: Yes, we will do  
28 that.

29 THE COMMISSIONER: Yes, just  
30 one other question, and I'm not anticipating the

Messrs. Dau, Williams, Mollard,  
Watson - InChief

1 whole thing, but is it fair to say, Mr. Genest, that  
2 you don't have to answer if you don't wish to, but is  
3 it fair to say that cross-delta route is not one that  
4 would be appropriate if you were required to proceed  
5 from Prudhoe Bay by the interior route?

6 MR. GENEST: I think that's  
7 fair to say.

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

Q You were on Appendix  
"A", Mr. Dau. These are set out as examples of pipe-  
line route relocations. Did you want to comment on  
any of others?

A The others are not as  
major as Travaillant Lake. They involve movement of  
land relocations of up to one mile to avoid the en-  
vironmentally sensitive areas. They are just examples  
of that.

Q Now I take it that since  
you had a number of disciplines involved in this  
you received many suggestions.

A Yes sir.

Q Was it possible  
to accommodate all of the groups -- the biologists,  
the environmentalists, the engineers?

A No, that was not  
practical in all cases. In some instances we adopted  
the route location represented a compromise. Examples  
of this are:

(1) Along the north slope of Alaska and the Yukon  
Territory, the group concerned with bird life wanted  
the line set back as far as possible from the coastline.  
The people concerned with animal life -- caribou in  
particular -- wanted to see the route away from the  
mountains and foothill ranges and towards the  
coastline. In this instance the middle ground between  
these two features was selected, where possible.

Another example, along the east side of the  
Mackenzie River, the bird consultants would have

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 preferred the line set back from the river, whereas  
2 the fish consultants preferred a route closer to the  
3 river and away from the headwaters of the tributary  
4 streams. In general, again the middle ground was  
5 selected.

6 The only major area where all  
7 environmental disciplines have strong reservations  
8 with respect to routing is along the Canning River on  
9 the interior route alternative in Alaska. This is  
10 particularly opposed by the fish and animal groups,  
11 and to a lesser extent by the bird group who have  
12 concern for the rare and endangered species inhabit-  
13 ing the valley. Later in our testimony we will deal  
14 with the methods to be employed to alleviate environ-  
15 mental and socio-economic concerns by methods other than  
16 route selection.

17 Q That, I take it, is  
18 going to be in your construction?

19 A Yes, it involves  
20 construction scheduling later on.

21 Q I'd like to move on now  
22 to the Fort Simpson revision, and perhaps we could  
23 get Mr. Williams' service well, we / again, / know where the original  
24 route is, to describe what the changes are.

25 A Well, I'll give you  
26 a little background first. In selecting the route  
27 and river crossing locations as originally filed,  
28 we examined routes east and west of Fort Simpson. At  
29 that time we selected a route west of Fort Simpson  
30 on the basis that:

Messrs. Darr, Williams, Mollard  
Watson - IN Chief

(1) The route was shorter than the east of Simpson alternative by some two to four miles, depending on the refinements selected on each;

(2) The route crosses less muskeg terrain south of the Liard river crossing;

In balance, after taking into account the shorter length, the two river crossings and the muskeg terrain, the route selected was less expensive both in capital and operating costs, <sup>that is</sup> and/the route west of Simpson.

Finally, we could find no significant environmental or socio-economic advantages to either route as compared to the other.

In our continuing studies we have, however, concluded that one change in design would be desirable; that twin pipelines should be installed at certain of the more critical river crossings. Such a change, twin or dual crossings of the Mackenzie River west of Fort Simpson, increases the cost of that routing alternative significantly, and in balance shifts the cost comparison <sup>to</sup> slightly favor the east of Simpson alternative -- even after allowing for the dual crossing of the Mackenzie east of Fort Simpson.

Q What's the reason that you concluded that you should have twin pipelines at major crossings?

A We do not expect to have failures in river crossings. We think the possibility of that is almost zero. However, the

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 consequence of having a failure at a river crossing  
2 at exactly the wrong time of year, which would be  
3 in freezeup or breakup, would be that the line would  
4 be out of service for one or two months or more. That  
5 consequence is so expensive, so great, that dual  
6 river crossings have been selected and they are --

7 Q As an insurance --

8 A -- as an insurance  
9 policy.

10 Q Sorry, I interrupted  
11 you.

12 A Well, the east of  
13 Simpson routing has the additional advantage of  
14 avoiding a crossing of the Liard River.

15 We have therefore concluded  
16 that the change should be made to the more easterly  
17 crossing. The new routing as described in the  
18 revised exhibit departs from the original route,  
19 near MP 583, and follows a roughly direct line to  
20 the Mackenzie River crossing about six miles upstream  
21 of Fort Simpson. From this crossing the new route  
22 proceeds almost directly on course to rejoin the  
23 earlier route in Northern Alberta near MP 860.

24 Q That's already shown  
25 on the map on the wall. -- the change --

26 A Yes sir. Its total  
27 length would be slightly more than that on the  
28 original route.

Messrs. Dau, Williams, Mollard,  
Watson - IN Chief

1 THE COMMISSIONER: Excuse me,  
2 how many dual pipeline crossings will there be?

3 A On the prime route there's  
4 a dual crossing at the Peel River crossing, at the  
5 Mackenzie crossing at Point Separation, at the Macken-  
6 zie crossing at Swimming Point, and at the Mac-  
7 kenzie crossing at Fort Simpson.

8 MR. GENEST: Mr. Dau, I  
9 want to direct your attention now to the report of the  
10 pipeline Application Assessment Group and perhaps  
11 to preface my question I could do it this way, that  
12 the group has expressed a number of concerns throughout  
13 the report which may be said to bear indirectly on  
14 the route selected. I want to ask you to comment  
15 only on those which relate directly to the engineering  
16 aspects of route selection, and I have specific  
17 reference, I think the most specific one was made in  
18 connection with terrain analysis and that appears at  
19 page 183 of the report. Was the report prepared before  
20 or after you filed your responses? What is your / understanding?

21 A We filed our responses  
22 and then we got copies of the report after the  
23 responses.

24 MR. GENEST:  
25 I think it's common ground,  
26 isn't it, Mr. Scott, that -- I believe it says so in  
27 the report -- that <sup>they</sup> / hadn't had the benefit of our  
28 responses when the report was issued?

29 MR. SCOTT: Hadn't had your  
30 responses.

MR. GENEST: Didn't give an

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 inch. At page 183 there is some criticism of  
2 the degree of detail, the lack of detail of terrain  
3 information, in your exhibit. Do you have any comment  
4 on that?

5 A Yes, we think we have  
6 responded to some of these concerns in answers to  
7 questions 13 in the response, to a minor degree in  
8 question 13; and also question 17 in respect to  
9 location of facilities and terrain analysis. We'd  
10 like to stress and we believe that the data attained  
11 from the terrain analysis performed <sup>to date</sup> is entirely adequate  
12 for route location at this stage. Terrain analysis  
13 is only one of the many considerations used in route  
14 selection. River and stream crossings, slopes,  
15 drainage, the lengths of the individual land sections,  
16 wildlife considerations, and construction difficulties  
17 and costs are also very important in the final route  
18 selection.

19 Q There's another concern,  
20 I think, raised at 8.5 -- Section 8.5 of the outline  
21 Assessment Group Report in connection with slope  
22 stability and erosion susceptibility. I always put  
23 the accent on the wrong syllable.

24 A Yes, they suggest that some  
25 potential failures could be avoided by re-assessment  
26 of location of the pipeline on access roads, particul-  
27 arly at valley crossings. We agree and have said so  
28 in quite a number of the responses for this request  
29 for additional information. It's spread over many of  
30 the questions and responses.

Messrs. Dau, Williams, Mollard,  
Watson - In Chief

1 Q Do you agree that they  
2 will have to be a reassessment made?

3 A Yes sir, in the final  
4 design and final field investigations.

5 Q Do you have any other  
6 comments? There was another one, I believe, at Section  
7 8.8.

Q Then in Section 8, 13  
of the report, page 252, some concerns were raised  
as to the construction of pipeline facilities and  
roads. What were these concerns? I read them

1 yesterday, Mr. Dau, and I seem to have forgotten --

2 MR. DAU:

3 A The response to question  
4 16 -- discusses in considerable detail the limits  
5 to which compressor stations can be moved. There  
6 is a suggestion here that some of them should be  
7 moved some distance and there are some limitations  
8 that become hydraulically unbalanced if they are  
9 moved too far and --

10 Q Can you explain that a  
11 little bit -- it is something that my grandmother  
12 would have trouble with. How do you become hydraulically  
13 unbalanced?

14 A Can I dig up Question  
15 16 first?

16 Question 16 discusses firstly  
17 an ideal pipeline which has no changes in elevation  
18 and on this, this is assuming a dead level terrain.

19 On this theoretical, ideal  
20 pipeline, relocating one station upstream from its  
21 hydraulically balanced location, in other words the  
22 precise location that it should be to be most  
23 efficient, if we move it upstream by half a mile it  
24 affects the total throughput of the system by about  
25 0.2%.

26 Q Let's go back there,  
27 Let's go back to the fundamentals. A compressor  
28 station -- which before I started this case I did not  
29 even know you needed -- is there to add -- to keep  
30 the gas moving, do I understand that correctly?

1 A Yes, as the gas flows  
2 down the pipeline it expands and as its pressure  
3 is reduced the compressor station recompresses the gas  
4 up to the design limit.

5 Q And you need a number of  
6 them to keep pushing the gas through the pipeline--  
7 am I right so far?

8 A Yes, it is very similar  
9 to a pump on a liquid system.

10 Q You do not mind my leading,  
11 do you, Mr. Scott?

12 MR. SCOTT: No, anything that  
13 will aid your comprehension.

14 MR. GENEST: And there is  
15 a point at which these pipelines must be located to  
16 fulfill their function, --

17 A These stations, yes,  
18 sir.

19 Q And is that what you  
20 mean by hydraulic balance?

21 A Yes, sir. Theoretically  
22 precise location by going through all the mathematics  
23 and saying, "I need a station at milepost 816.72."

24 Q And you do that by applying  
25 the laws of physics?

26 A Yes, sir.

27 Q So -- I interrupted  
28 you.

29 A Well, this particular  
30 response says that if you move it upstream by a half

1 a mile you lose .2% in throughput, downstream about  
2 half a mile .07 in throughput. Unfortunately  
3 this is not an ideal pipeline and we do have  
4 terrain relief and because of the terrain relief the  
5 stations can -- are not equally spaced, in other words,  
6 they are all not precisely 50 miles apart.  
7 If in fact the terrain is -- if we are essentially  
8 going down hill, the station spacing tends to spread  
9 out. They may be 55 miles apart if we are going  
10 down a hill, a long hill. If we are going up  
11 a hill they become closer.

12 Now, when the slope of the  
13 hill approaches the slope of the pressure  
14 drop in the system, the station can be moved  
15 considerable distances without much penalty, but in  
16 the converse case, if you are going up a hill your  
17 limits are very narrow.

18 We have some limits in moving  
19 stations -- you know, we cannot move them many miles  
20 without suffering a large penalty in throughput.  
21 We can suffer penalties by putting in more horse-  
22 power. At some of the stations we could move them,  
23 but that is also suffering a penalty in economics and  
24 cost and so on.

25 Q what is a major move,  
26 what is a minor move?

27 A A half a mile we can  
28 live with in most locations. Beyond that we get  
29 concerned.

30 Q Right.

Dau, Williams,  
Mollard, Watson  
In Chief

1734

1 A Lateral movements have  
2 no effect of course.

3 Q So it has got to be close  
4 to your pipeline?

5 A Yes, sir.

6 This particular section  
7 of course was also raised, concerned about -- concerns  
8 about other locations -- other facilities, I am  
9 sorry; the locations as shown on the application are  
10 based on information available from terrain analysis,  
11 air photo study and reconnaissance. I am confident  
12 that detailed field investigation and detailed design  
13 will probably result in minor relocations of some  
14 of the facilities. But this is in a later, final  
15 design stage when there is a lot more field informa-  
16 tion available to us.

17 Q There is another  
18 concern expressed, and I am almost through, sir. Do you  
19 want  
20 /to go on or adjourn -- I see that we have reached the  
21 witching hour -- I can -- I will finish this  
22 panel in another five minutes.

23 THE COMMISSIONER: Well, cer-  
24 tainly, let's carry on then.

25 MR. GENEST:

26 Q Section 10.2 of the  
27 report -- that is the Pipeline Assessment Group  
28 Report, discusses pipeline and highway interaction --

29 A yes, sir.

30 Q And that appears at  
page 348 to 356 of the report.

1                                   A     Yes, this section dis-  
2 cusses the advantages and disadvantages of close  
3 spacing of the highway and the pipeline and as I read  
4 it, although no firm conclusions are drawn, it appears  
5 that the case for wider separation is stronger than  
6 for close separation. We agree with that.  
7 Once the highway location is finalized and at the  
8 present moment that is not the case -- there are  
9 changes coming up all of the time and when the  
10 results of detailed field investigation of the pipeline  
11 route are available, again we are confident that  
12 minor relocations of the pipeline route will be  
13 required.

14                                   The number of pipeline  
15 crossings of the highway should be minimized as  
16 much as possible and parallel spacings of something  
17 less than a thousand feet should also be minimized.  
18 That does not mean that we can always maintain a  
19 thousand feet spacing. There will be areas where  
20 closer spacing will be required due to terrain,  
21 some side slopes, lakes, mountains and so forth.  
22 This is the Mackenzie Highway, of course, that I am  
23 referring to.

24                                   Q     Now, we have not  
25 dealt with all of them, throughout your replies and  
26 I think throughout the requests for supplementary  
27 information by the Assessment Group, there is an  
28 acknowledgement that there is a final design stage  
29 at which some of these questions can only be answered  
30 -- or at which some of the concerns raised must be

1 settled. Could you comment on that, Mr. Dau?

2 A No, I just agree that  
3 some of these concerns can only be answered in the  
4 final design phase. We have got detailed field in-  
5 vestigations underway. I am very confident though  
6 that the combination of minor route locations and  
7 special designs and when we are into the detailed  
8 design phase that we can solve these concerns.

27  
28  
29  
30

Messrs. Dau, Williams, Watson,  
Mollard - In Chief

1 MR. GENEST: Q With the  
2 final design phase, that would only be undertaken  
3 after the Minister has granted the right-of-way and the  
4 National Energy Board has granted a certificate of  
5 public convenience and necessity?

6 A Yes, essentially yes,  
7 because it obviously involves a lot of office time,  
8 drilling programs. They're very precise and things  
9 like that are very expensive programs, involve an  
10 awful lot of field work.

11 Q Well, did you have a  
12 ball park figure, Mr. Dau, as to what it would cost  
13 an engineer to fully engineer the pipeline beyond the  
14 stage to which you've progressed?

15 A Yes, several hundreds  
16 of millions of dollars.

17 Q And until you have a  
18 certificate, how do you consider that price tag?

19 A I think --

20 Q Is it justified or not  
21 justified?

22 A It's not justified, sir.  
23 No.

24 Q And in any event, what,  
25 I suppose -- well, that's a matter for argument.  
26 These hearings may have some influence on locations  
27 picked for the gas pipeline and on final designs  
28 which we would have to scratch and start over again.  
29 Would that be correct, Mr. Dau?

30 A Yes sir.

Messrs. Dau, Williams, Watson,  
Mollard - In Chief

1 Q You would cross the river  
2 at point "A" and as a result of these hearings or the  
3 N.E.B. hearings you had to cross the river at an  
4 entirely other point, what would happen and what would  
5 be the value of your final <sup>design</sup> study at point "A"?

6 A It would have very limi-  
7 ted value, it wouldn't be totally lost but I mean, any  
8 information you gain is of value to you but certainly  
9 you'd have to duplicate it at another location.

10 Q Right. Finally, sir, may  
11 I ask you in your professional opinion whether the  
12 prime route you've described is feasible?

13 A Yes, it is. In my  
14 opinion it's appropriate, efficient, and a feasible  
15 route.

16 Q And could I ask you the  
17 same question as to the interior route which you al-  
18 ready said you consider less preferable?

19 A It's not as efficient,  
20 and it results in a higher cost, more difficult con-  
21 struction, and more difficult operation. It is  
22 feasible.

23 MR. GENEST: Those are all  
24 the questions I have, Mr. Commissioner, of this  
25 panel.

26 THE COMMISSIONER: Have  
27 counsel agreed on the order of cross-examination?

28 MR. SCOTT: Mr. Commissioner,  
29 I think the order of cross-examination <sup>been</sup> has stipulated  
30 before, if not in a ruling, in a consensus agreed by

Messrs. Dau, Williams, Watson,  
Mollard - In Chief

1 counsel. I will discuss it with them privately, if I  
2 may, just so it will be clear that there is no doubt  
3 about it. That presumably will not begin until tomor-  
4 row morning.

5 Mr. Bayly, however, indicated  
6 to me that he had one or two matters that he wanted to  
7 raise with you as opposed to the panel. If that could  
8 perhaps be done before we finish today?

9 THE COMMISSIONER: Yes,  
10 certainly. Just before you do that, this cross-delta  
11 route, Arctic Gas sent a drawing of the cross-delta  
12 route to the Inquiry and I've taken the liberty of  
13 examining it and would you, Mr. Genest, perhaps in  
14 collaboration with Mr. Ballem, prepare by the time  
15 we reach<sup>the</sup> cross-delta route presentation, prepare some  
16 kind of a drawing that shows the relationship of the  
17 cross-delta route to the proposed gas plant and gather-  
18 ing line facilities that are -- the producers want to  
19 establish in the Mackenzie Delta?

20 MR. GENEST: I think that  
21 will be very useful if I can have Mr. Ballem's co-  
22 operation I'm sure we can arrange it.

23 MR. BALLEM: I'm sure we can,  
24 Mr. Genest.

25 THE COMMISSIONER: Yes, Mr.  
26 Bayly?

27 MR. SCOTT: The order of  
28 cross-examination I would propose is contained, I  
29 think, on page 2 of Preliminary Rulings No. 2. We  
30 indicated previously that if there are any persons

Messrs. Dau, Williams, Watson,  
Mollard - In Chief

1 who are not major participants who have questions to  
2 ask, they can be conveniently arranged if they would  
3 be good enough to speak to either MR. Waddell or  
4 myself and we will make arrangements for them to put  
5 their questions at a time convenient to them and to the  
6 other participants.

7 MR. GENEST: Preferably before  
8 the panel has left for the south, Mr. Scott.

9 MR. SCOTT: We'll do what  
10 we can.

11 THE COMMISSIONER: Yes, Mr.  
12 Bayly?

13 MR. BAYLY: Mr. Commissioner,  
14 I just have two points to raise for your consideration,  
15 and one has to do with the summaries which your  
16 preliminary rulings require the participants to file  
17 in advance of the presentation of their witnesses,  
18 either as individuals or as panels, and my comments  
19 arise out of how this appears to be working or not  
20 working.

21 Now we did receive a summary  
22 of this first panel's evidence and I am grateful that  
23 Mr. Genest has expanded on that. I believe the test  
24 he said he was using was to make it so that his  
25 grandmother could understand it; but what that has  
26 involved is leading from Dr. Mollard evidence that  
27 we did not know about in advance. I would hope that  
28 if Mr. Genest is going to expand the evidence, to be  
29 led from any panel, that he will give us the requisite  
30 notice so that we can take it back to our people and

1 our grandmothers or whoever, so that it can be under-  
2 stood by us as well. I think that is the purpose of  
3 the summaries, as you defined them in your rulings,  
4 to give the participants the advance notice to prepare  
5 for the evidence as it comes out in chief.

6 The other point I wish to  
7 raise was with regard to the cross-delta proposal,  
8 and because I noted today that we received the supple-  
9 mentary material on the Fort Simpson alternate route,  
10 on the day in which that evidence was given, and I  
11 don't fault Arctic Gas for that but on the other hand  
12 I would hope there would be some way to make sure that  
13 does not happen in any other route changes, and  
14 specifically <sup>not</sup> in the cross-delta route change for  
15 two reasons:

16 (1) That it makes it very difficult at the time of a  
17 formal hearing to deal with that and prepare for  
18 cross-examination on route changes that we don't  
19 know the specifics of.

20 (2) The other is with regard to the native groups  
21 especially, in order to prepare for community  
22 hearings it is very important -- and I refer  
23 specifically to the cross-delta route that we  
24 have the kind of information that we expect we  
25 will find in the supplementary material sufficient-  
26 tly in advance so that we can tell the people in  
27 the communities about it, and so that we can plan  
28 a sensible schedule for community hearings.

29 Now I feel we are not able  
30 to do that with regard to certain delta communities

Messrs. Dau, Williams, Watson,  
Mollard - IN Chief

1 until we get this material from Arctic Gas, and I  
2 would hope we would get some idea from Mr. Genest of  
3 when that will be available. We did first hear about  
4 the possibility of a cross-delta route in January,  
5 but as yet we have not received anything specific  
6 except for the map which you, Mr. Commissioner, have  
7 before you today.

8 MR. GENEST: I think Mr.  
9 Bayly's point as to cross-delta is well taken. We  
10 appreciate the problems that that creates. It's in  
11 a sense self-policing because if we're late with it  
12 we're going to be faced with requests for an adjourn-  
13 ment and so on, which is something which we would  
14 like to avoid, and I hope, as I said earlier, I  
15 hope to be in a position later this week to, instead  
16 of saying "soon" to be more specific and we are endeavoring  
17 to get this into the Commission's hands and  
18 into the participants' hands as quickly as possible.  
19 But I should have something more definite later this  
20 week, sir.

21 THE COMMISSIONER: If you  
22 have -- well, at any rate, when we are up in Aklavik,  
23 early in April, we will maybe able to spend a day or  
24 two (not the Inquiry -- at least not this whole gang),  
25 but we might be able to take a look at that.

26 MR. GENEST: Well, it certainly  
27 changes the impact on Aklavik, for instance, quite  
28 dramatically.

29 THE COMMISSIONER: Well,  
30 we'll find that out.

Messrs. Dau, Williams, Watson,  
Mollard - In Chief

1 MR. GENEST: That's right.

2 THE COMMISSIONER: -- in April.

3 That's all then, is it?

4 MR. GENEST: Well, sir, this  
5 summary business is giving me a little difficulty.  
6 I thought that Dr. Mollard's exposition was not in the  
7 kind of classification of evidence that I should try  
8 and spell out word by word. It would be very difficult  
9 to do that with Dr. Mollard, with all due respect  
10 to him. He always has a lot to say.

11 (LAUGHTER)

12 THE COMMISSIONER: Well, it  
13 was all worth hearing, I thought.

14 MR. GENEST: Yes. It's --  
15 and to have a stilted reading, to be bound to  
16 every word that I say without asking for explanations,  
17 I find it a little difficult. If I catch my friends  
18 by surprise, I ask them to be patient with me. I'm  
19 going to try with these comments to deal a little  
20 more full where I foresee that there will be perhaps  
21 explanations required, but if it creates a severe  
22 problem or a handicap which I suggest would have to  
23 be demonstrated, then of course I will have to pay  
24 the penalty and say, "well, you bring these fellows  
25 back, so that I can prepare adequately."

26 I realize what a disorganizing  
27 note this puts in the hearing, so I'll bear these  
28 comments in mind. I certainly agree that the -- our  
29 advance notice of government assesement group concerns  
30 was not adequate and I will try and do better in the

Messrs.Dau,Williams,Watson,  
Mollard - In Chief

1 future.

2 MR. SCOTT: Mr. Commissioner,  
3 shall we adjourn until tomorrow morning then?

4 THE COMMISSIONER: Yes, we'll  
5 adjourn until 9 A.M. tomorrow.
